Crap snipped

What the fuck are you on? Fuck off you dumb asshole.

We need an Inventor/Engineer who has the ability to recreate in a new simple system the 7800 console!

O'Shea, Ltd. is located in Kansas City, MO since 1975. We own 1 million Atari game cartridges from the late 70's. Many of you know that the Atari 7800 uses 8-Bit graphics. We are looking for someone to remake and simplify the 7800 inner workings of the consoles i.e.board, chips, wire layout, and anything else that might be needed.

The units need to be able to plug into TV or computer, have a cartridge slot, and be able to use 2 joysticks. We are looking for a easier way to manufacture the system. Our plan is to manufacture 200,000 of these units and kit them each with 5 of our Atari Cartridges & market them at retail throughout the US.

If you have the engineering background and ability to reverse engineer the old 7800 console and
are able to design this unit please contact us.

Thanks,
Brian Raynor

Hello Atari fans!

I'd like to know what the maximum baudrate of a ST in synchronous serial mode is. The reason why I ask this question is because I read in a book (ST Profibuch, german) that there is a "Clock Bit" in the USART Control Register ($FF FA29). The book says that in synchronous mode this bit can

be set to 0 which causes the baudrate to be equal to the frequency of
the MFP timer. If the bit is set to 1, which is only possible in
asynchronous mode according to the book, the frequency of the MFP timer
is divided by 16. Does this mean that the serial port of the ST is 16
times faster in synchronous mode than in asynchronous mode?

Matthias

composite will never be as good as separated RGB

It'd be better just to get a RGB scart input TV. that worked flawlessly for
me.

Not very good, really. NTSC (or PAL, for the Europeans) just cannot compare
with pure RGB. It is fun to play golf on your 45 inches TV but you do not do
any word processing here... I do not recommend it UNLESS you realy have no
other solutions.
Good night!

Is there a SCART output option for the ST? Can it be modified to work on
an NTSC tv?

I'm interested in playing ST games on a large screen. The ST monitor is
too small, and I have no way of getting ST low res to work on a VGA
monitor. How difficult is this device to build? Perhaps u could build
it for me :)

the monitor output of my ST worked perfectly on the separated RGB scart
input of my TV. there used to be cables available, worked with the Amiga 500
too. it was a Pal TV however, and the picture quality was far superior to
any colour monitor Atari ever sold :)

The device is not difficult to build at all but i think it will be difficult to find the 1377 today... Your best option is to find an Atari 520 STFM. It has the modulator built-in.
Good night!

There is (well, "scart" is a huge collection of signals, but the R, G and B lines on a scart cable are exactly the same as what the ST sends to any color monitor) and it needs no modifications. The difference between PAL and NTSC only matters for modulated signals (composite video, RF). Except for the refresh rate, come to think of it, but you can softwarematically change the ST between 50 and 60 Hz, and most modern TV sets handle both. :)

Maurits.

I don't remember exactly where....
but not long ago I saw such a device listed in some Atari shop's inventory.
I'm fairly sure it was one of these three places:
ATY
Best Electronics
Ben Smith

It was described as a box to hook your regular ST (without RF or composite outputs) to a TV set or VCR. My memory may falter, but I think it cost about as much or more as a refurbished RGB monitor.

Brian

Hi All,

Is this case suitable for re-casing a Falcon, i.e. does it have enough room for ide cd drives and 3.5" eide hard drives?

Where can one now acquire the Desktopper?

Thanks

But does the SCART cable plug into an RCA composite connector on
an NTSC tv, or to a seperated TV input consisting of 3 video inputs?
Have u tried it with an NTSC TV? Thanks for the info.

No, a scart cable plugs into a scart socket :)

If you dont have a television with an RGB scart socket this option isnt
available to you. AFAIK Scart is very popular in europe but nowhere else.
which is unfortunate. seperated RGB input would be a great feature
everywhere else too!

 I was looking at the circuit the other day, and was wondering about the
audio outputs. Does your circuit have sound? Is it demodulated? There
doesn't appear to be an active audio out on the circuit. How did you
get around this problem? Thanks.

Okay folks,

This is for all those who would like to help me out: I have a spare ATX tower case, the cpu burned out a few weeks ago, but the drives and power supply are fine. What would I have to to do get my falcon mainboard into that case, without carving the case all to crap?

Thanks!!!

In message <6d40f6fd.0401221005.7296ed76@posting.google.com>, d_mango1@yahoo.com said:

>But does the SCART cable plug into an RCA composite connector on
>an NTSC tv, or to a seperated TV input consisting of 3 video inputs?

The SCART cable is only useful for devices that provide a SCART socket. Most European TVs, VCRs, DVDs and many Satellite tuners do, but I don't think they are available on US sets (may be some Japanese ones?).

My Philips monitor had a SCART input socket and was supplied with an Atari 13-pin DIN to SCART cable. But if you don't have a SCART socket but do have separate R,G,B video inputs on your TV, you should be able to connect the relevant pins on the 13-pin DIN to them - with the ST series: pin 6 G, pin 7 R, pin 10 B, pin 13 Ground (shielding), pin 1 audio out. If there is no sync input on the TV, you may have to tie the composite sync on pin 2 to, perhaps, the G input as well.

You can NOT use the RCA composite connector if your ST doesn't have a modulator (unless you add the relevant circuitry).

>Have u tried it with an NTSC TV? Thanks for the info.

No :-(

Regards, /Peter/

Note again from the above: 'well, "scart" is a huge collection of signals,
but the R, G and B lines on a scart cable are exactly the same...'

which means that you need a TV or monitor with SCART inputs that can handle
separate Red/Green/Blue/Hsync/Vync signals. SCART also contains (on other
pins) a composite video input, stereo sound inputs, etc. Unfortunately,
some manufactures of cheaper TVs cheat when putting SCART on their products,
as they provide -only- the composite video input (and possibly sound
inputs)- which is totally inconvenient in this particular case (or, more
likely, in any case).

The MC1377 is a bit tricky - i once built a similar circuit (however for PAL, not NTSC). Moderately easy to get it working, but difficult to get decent picture quality - it probably requires a double-sided, etched PCB and good layout practices.

Furthermore, I miss the luma trap LC filter, and the delay line between pins 6-8 is also missing - better look at the MC1377 data sheet for an example how to do it right.

Using some more modern chip, like the AD725 from Analog Devices, with integrated tuned filters and digital delay line will probably provide better results - the sample schematic from the datasheet should work nearly 1:1 (change the input connector and leave out the buffering op amps for the pass-through option).

I never built anything with the AD725, but if someone wants to try, I can offer a limited supply of samples (in SOIC-16), together with matching MK2715 clock generator.

How do you hook up the audio to an external amplifier? As far as
I know, my Stacy does not have an audio out.

SCART is just a collection of signals, it doesn't convert anything.
Composite video is one of the (possible) signals so there are cables
with SCART on one side and an RCA for composite video on the other side,
but it the SCART source doesn't offer this signal, it's no use.

And the STs that don't have a TV-modulator, also don't supply composite
video. :)

> Have u tried it with an NTSC TV? Thanks for the info.

Nope, I never had the "pleasure" of dealing with NTSC equipment. ;)

Anyway, composite video is the first step in the modulation process
(going from separate RGB to tv-signal) where NTSC and PAL are different
systems. The color is modulated in a different way, so you'll get
black&white picture if you use the wrong system.

Maurits.

Ooppss! I forgot... It was so long ago.

There is a pin on the video connector labelled "Audio" (i do not remember wich one.) I drilled a hole on the back of my 1040 and installed a RCA jack. Solder a wire from the ground of the jack to the ground of the ST. Solder another wire from the center pin of the jack to the "Audio" pin of the video connctor. You now have a "line out" jack on your Atari ready to be connected to any ordinary audio amplifier.

You connect it in "tape in" or "line in" or "auxiliary" but NOT in "phono in".
I do not know if there is enough room in the Stacy to place the jack close to the video connector. If you must place the RCA jack far away from the connector, use a shielded cable for connection.
Good night!

Hey James, really not wanting to be a pest but, if you have your falcon, or
st, re-cased in a desktopper, could you send me a couple 2 or 3 pics of how it
looks inside with the cover off?

Also, where could I possiblly find one of these cases?

Thanks
Sam F.

I downloaded the afros cd....it's pretty cool.   I don't understand how to set
aranym to use the full screen. The Atari machines automatically do this, it
seems.

Thanks,
Sam F.

That pretty much depends on the individual case, you'd need to take your MB
out of your falcon and try it for fit to see what needs moving or reshaping.

Hello All,

I've got a curious problem that even Wizztronic, after having my Falcon for nearly a year, couldn't fix, or at least duplicate in order to fix.

Then again, it could be the way I'm doing things i.e., incorrectly!!

I have extendos pro installed. I have a 2x scsi cd drive. When I boot my Falcon, then powerup the cd drive, my data on C:\ gets all screwed up. I don't know why.
The scsi id on the cd drive is set to 5. The scsi cable was replaced after this happened the first time, so I don't think it's the cable.

Is there a particular order that the Falcon and external devices need to be powered up?

Again, Wizztronics stated they hooked up a cd drive to it and had no problems.

Hopefully, one of you might know or be able to point to what the problem is.

See, this is why I want to re-case the Falcon, get a higher capacity psu, and use ide drives.

Oh well, thanks for the attention and help.

Those of you who use your Atari's (not counting the Atari clones, sorry) for
web surfing.  What modems are you using, and which isp's are you using?  The
reason I'm asking is because most of them seem to have some software that needs
to be installed, but is not made for Atari systems.

Well folks, it happened again. This time it happened while I was copying files
over from the Extendos disk. Folders on the drive started having strange
characters in place of the letters. And yeah, the boot partition is pretty
much toast. Luckily, I copied the entire boot partition into a folder on the
other (D) partition. Hopefully, all I'll have to do is re-format the boot
partition, then just copy everything back over to it and viola!
Man, whatever you can think of folks. I'm starting to pull my hair out again,
and I don't have a whole lot of it left.
Thanks

Hi folks,
Is there a way to hook a Megafile 30 to a Mega STe for large .sng file transfers? When doing routine maintenence on my live show or sequencing for the studio I work on the megafile 30, then transfer all the files via floppy to the Mega STe, very time consuming. Any way to trick the Mega STe into thinking the Megafile 30 is the D, E or F drive? Or any suggestions for a quicker way to transfer files other than floppies?
Thanks,
fcr

No, there isn't. Your description strongly hints and wrong termination
or bad/too long cables. This is definitely a hardware-related problem.

FCR,

I'm a little confused. What is the megafile connected with when you are
'working with it'?
Another Atari? A Sampler?

If it's another Atari, why not make sure the Megafile 30 has a boot sector set, and simply move it from machine to machine. It will install itself to the first avilable partition (C: if there is not already a hard drive connected). If you have an internal hard disk in the MegaSTe, no problem....most Atari Hard drive software will see all your drives, including the Megafile who will be connected to the ASCI (Hard Disk) port in back of the machine. The partition order usually falls in line with the device ID (a hardware setting via jumpers, or switches). The trick here is just to make sure that the internal hard drive host is set to a different ID than that of your Megafile 30.

If you've an internal hard drive in the Mega STe....then you'll find inside a SCSI host adapter with some dip switches that can be used to set a DMA Address. Inside your Megafile 30, there is a similar set of dip switches. No need to open both....one or the other....make sure they are set to different IDs and you should be in buissness.

If you're running some kind of external SCSI host on your Mega STe....again, shouldn't be a problem....just daisy chain the Megafile 30 between your STe and the link (other external hard drive system).

AFAIK, all the Hard Disk software for TOS/GEM machines will be able to drive your Megafile 30 and put it on the desk top just as a hard drive should be....even if mixed with other hosts and drive types.

Sometimes....
I run across a raw SCSI kit that's just been put in a Megafile case. I.E. Some guy took out the old RLL drive and ASCI/RLL host etc....and replaced it with an inlaid SCSI drive and cableing to hook right up to his AKAI, Peavey, Kurzwiel, etc......Sampler.

If something like this is the case..........I need to know more about what you're doing with the 'mega file 30' and what all you wish to connect it with.

Brian

> So what's this port on the Falcon actually good for?

I use it to get an extra MIDI input (16 channel total, merged) and output
(Additional 16 channels, total 32) with CuBase Audio.

There is a driver with M-ROS that is reported to work with some Apple targeted
MIDI interfaces.
In my case, the Anatek SMP 7 MIDI patch bay does indeed work with this driver.

The SMP 7 is actually a 7 imput 8 output MIDI patchbay that happens to have an
Apple Talk port for optional use. As it turns out, connecting this to the
Falcon gives alot of extra flexability for input merging, filtering,
etc....while you still get the Falcon's own input and output ports. You get an
additional 16 channels output to your patch bay to play around with ;)

The only bug I've found in my case, is that you have to remember to unplug the
Apple Talk cable during boot-up. For some reason the machine will hang if the
SMP 7 is plugged in when the Atari boots. Wait till the desk-top is up, launch
CuBase, plug it in....and it works like a charm!

Hi "FCR"

> Is there a way to hook a Megafile 30 to a Mega STe for large .sng file

transfers?

Yep!, its the same way you utilise it for small or medium transfers, plug it in to the ACSI port and switch it on!.

>When doing routine maintenence on my live show or sequencing for
> the studio I work on the megafile 30, then transfer all the files via floppy
> to the Mega STe, very time consuming. Any way to trick the Mega STe into
> thinking the Megafile 30 is the D, E or F drive?

There's no trick involved, partition the drive as you wish it to behave. The mega will pick up drives in the order

SCSI ID / LUN (partitions)

e.g.

SCSI 0 LUN 0 (partitions)
SCSI 0 LUN 1 (partitions)

Right up to

SCSI 6 LUN 0 (partitions)
SCSI 6 LUN 1 (partitions)

> Or any suggestions for a quicker way to transfer files other than floppies?

Morse code , semaphore or dictation!!

If I want to re-partition the hdd, do I need to re-format the drive first? I'm
using the ICD 6.5.5 scsi pro utilities disk as I haven't gotten HDDriver yet,
but I plan to next month.

Thanks

No. Create new partitions and that�s it.
Only if this drive had a lot of bad sectors or the icd format is
different to ahdi/hddriver you should format the drive new.

Same as on IDE.
HDDdriver is the best i know.

Regards, Robert

Its purely a matter of choice, i always do myself to make sure i pick up any
duff clusters or other errors but its not essential and its not a equipment.

Others think the world will end when you format drives, that may have been
so back in the 40's but not so nowadays.

Hi all,

What does 14 bombs mean? Also, I can't get the Falcon to boot to floppy. Yes, I hold down both 'alt' keyes from the beginning, and I have an Atari Language disk in the drive. Everything was fine until I tried to switch (in Magic) the video to high color. The system seemed to be locked up so, I rebooted the Falcon and...14 bombs. 'Fatal Error In Gemdos: System Halted'. This happens just after Magx booter is loaded. But since I can't seem to boot to floppy, I can't do anything.
Help

Thanks,
Sam F.

Actually you have to be careful with old IDE drives. Formatting them makes them unusable, probably because formatting not only clears the data sectors but also wipes out system-relevant data structures.

```

SF0218 <sf0218@aol.com> wrote:

> What does 14 bombs mean? Also, I can't get the Falcon to boot to floppy

Number of Bombs and Meaning

2 Bombs
BUS ERROR. COMPO IC asserd bus error

3 Bombs

ADRESS ERROR. Processor fetched an instruction from
ROM or RAM which was not a legal instruction

4 Bombs
ILLEGAL INSTRUCTION. Processor was asked to
perform a division by zero

5 Bombs
ZERO DIVIDE. Processor was asked to perform a division by zero

6 Bombs
CHK INSTRUCTION. This is a legal instruction,if software uses this, it
must

7 Bombs
TRAPV INSTRUCTION. See CHK instruction

8 Bombs
PIVILEGE VIOLATION. CPU was in user mode, tried to execute a 68030
instruction that can only be performed in supervisor mode

9 Bombs
TRACE. If trace bit iss set in the status register, the CPU will execute
this exeption after every instruction Used to debug software

10 Bombs
LINE 1010 EMULATOR. CPU read an instruction which '1010' as its most
significant nibble. Used by TOS for low level graphics software routines

11 Bombs
LINE 1111 EMULATOR. CPU read an instruction which has '1111' as its most
significant nibble

12 Bombs
Unassigned, should be no occurrence

13 Bombs
Coprocessor Protocol Violation. A read of the FPU has rersulted in a
illegal value

14 Bombs
Format Error. The format word passed to the FPU was invalid

15 Bombs
Uninitialized Interrupt. An interrupt was received thad had not been
reset

16-23 Bombs
Unassigned, should be no occurance

24 Bombs
SPURIOUS INTERRUPT. Bus error during interrupt processing

25-31 Bombs
AUTOVECTOR INTERRUPT. Numbers 4 and 2 are used, others should have no occurance

32-47 Bombs
TRAP INSTRUCTION / Exeption. CPU read instruction which is used to generate a software exeption (GEMDOS,VDI or AES)

48-63 Bombs
MC68881 / MC68882 FPU exeption vectors

64-79 Bombs
MFP interrupts / vectors

80-95 Bombs
MC68901 MFP vectors (TT/Falcon ??)

96-111 Bombs
Zilog 86C30 SCC vectors (MegaSTE/TT/Falcon only)

128-255 Bombs
Unused

> disk in the drive. Everything was fine until I tried to switch (in Magic) the
> video to high color. The system seemed to be locked up so, I rebooted the

This work tricky. Have a look to magix.inf an the description of.

> just after Magx booter is loaded. But since I can't seem to boot to floppy, I
> can't do anything.

Cold boot only will help

Regards, Robert

Now I know there's a hack to let a DS/HD 3.5" drive work in an Atari ST as a 1.44m drive, but supposing I'm fine using only 720k DS/DD disks. Could I just pop a DS/HD disk drive into an old 1040ST and have it automatically work in only 720K DS/DD mode or would some hacking still be neccessary?

You mean for use in an emulator ? I think the program is usually bundled - it is a long time since I downloaded emulators though. I use a program called Makedisk which makes a virtual disk from a real ST floppy. It needs to be the right format - or you need to specify what the format is if ti different to normal.

Format the floppy on 720kb, and you're ready.
Both system can access it.

(I'm almost sure, that on HD diskettes, you have to tape one of the "holes"
in the corner)

Thanks for your answer, but...

No, what I mean is how to get files, mainly texts, from diskettes first used on an Atari ST, for use on a Windows PC.

Philippe

Note that the MS Windows gui is broken when it comes to formatting 720 floppies. In Win2000 you simply can't format a 720 floppy unless it is already formatted! On the other hand I have managed to read 1440 floppies formatted (on Atari) to 720 without covering the HD hole!

To format 720 floppies in Windows open a DOS window and enter the format command with proper parameters. Perhaps "format ?" will return available switches, my memory is short when it comes to MS DOS...

Makedisk can get you halfway there - put an Atari formatted disk in the PC drive and Makedisk can produce a single file that is an exact image of the disk surface. Then you can use an extractor program to produce files from the image file, or load the image file into an emulator like Steem and copy the files by dragging on the emulated ST desktop into a directory on your PC drive which Steem has been set up to use as its own emulated hard disk.

In my experience, high density disks that have had their identifying holes taped over to work like low density disks are unreliable.

They work for a while, but sooner or later they tend to get corrupted, so don't use them for critical files or files you want to keep for a long time. It'll save you lots of trouble if you can track down a source of authentic low density disks, or you could consider upgrading the ST to a high density drive, if you don't mind cutting a hole in the case to accept the drive front panel and doing a bit of soldering.

That's true...

It's better when using a disk format utility (i use winimage)

Hi Philippe!

That rather depends what format the text files are in! If it's pure ASCII, there should be no problem (once you use makedisk if your PC won't read the Atari-formatted disks - this depends on how old the Atari is, or rather what TOS it used; 1.4-on should be PC compatible. Even then, problems can arise if the disk was formatted non-standard, with more sectors or tracks, though I think makedisk can handle that.)

However, if the files are in a proprietary format, there could be problems. 1st WOrd/1st WOrd Plus for instance used the ASCII characters 29 and 30 for stretch spaces, and 2-letter escape codes for text styles. The whole document was prefixed with four lines of numbers and a ruler, such as

```
066000200000000132000004000000000
10
2-#-0
F0110000001
9[...................................................]0110
```

(some of these characters are unlikely to survive the ISO
conversion of the mailer, I fear).

Anyway, the preamble can be cut off in an editor such as notepad,
and you should be able to use the find and replace function to put
proper spaces in.

A similar thing applies if the text was written by some other
application.

Regards, /Peter/

My MegaSte with Tos 2.05 and 4mb ram used to boot from the hard drive (Seagate 157), I THINK! It's been a few years since I've used it and actually do not remember. Anyway, here are the problems I have been having trying to boot from the hard drive:

1. On power up (no floppy in drive A) the hard drive comes to life and I get bombs across screen and the "not enough memory run FOLDR100.PRG" error.

2. I boot from floppy, run AHDI program and nothing happens - it doesn't seem to do anything and nothing happens when I try to "install devices". Still bombs on reboot.

3. I created a modified AHDI using a utility HDPATCH which allows me to select an option to SCAN ALL ACSI DRIVES. Then I run the modified AHDI from the floppy and it locates my hard drive in slot #2 (nothing anywhere else). Then when I "install devices" VOILA! Icons for partitions C, D, E, F magically appear on the desktop and I can access all data on the drive. Hooray - my data is intact. ONLY PROBLEM: as soon as I turn the computer off I am back to square one - still no booting from hard drive, just bombs. The icons are also gone when I reboot from the floppy, but that may be because I forgot to save the desktop. (it's been a long time!)

4. I've tried running HDINSTALL and it says "There are no logical drives".
5. Ive tried running HDX and it can see drives C, D, E, F. Running the "mark bad" option reveals no bad sectors on any partition.

What am I doing wrong? Is there a step I am missing? Is the boot sector of my drive damaged and if so, what is the solution? I would really rather not have to reformat and have to re-load all my data.

Any input would be appreciated. Thanks!

It the Atari disk was formatted with TOS 1.4 or Higher, then all you have to do is to just put it in the PC and the files should just come up. For users with TOS less than 1.4, there are special formatting programs that will format a disk with a special sector that will allow it to be read in a PC.

That's strange. Since you get the message, it is obviously reading the hard drive at that stage. Perhaps your FOLDR100.PRG is corrupt?

>2. I boot from floppy, run AHDI program and nothing happens - it

What ID is your drive set to? AHDI scans from 0 and stops if it finds a gap - so if the ID is 1, say and there is no 0, AHDI won't find the disk.

I suggest you try the demo version of HDDRIVER - if it works, buy a copy. It's by far the best hard drive utility around!

>What am I doing wrong? Is there a step I am missing? Is the boot

Since it attempts to read the AUTO folder (cause of the FOLDER100 error message) I suspect the boot sector is OK. But the FAT may be screwed. Try disabling AUTO (rename it to AUTOX) and all ACCs, and try again.

Regards, /Peter/

ID is set to 2. I don't know how to set it, but that is where it is
and is probably the problem. There is nothing in ID 0 or 1. Should I
set the ID to Zero and if so, how?

ctdl.sys.atari.st:26 fr.comp.sys.atari:2003 maus.computer.atari.falcon:1429

Easiest option...
Hit the ST ftp sites and find a utility to convert the boot sectors of your ST
formatted floppies so they have the little MS_DOS code where it belongs. See,
the disk formats are the same, the fat tables are the same. Only difference is
that early versions of TOS set a unique disk ID each time you formatted a disk

from the desk-top. This way TOS/GEM had the potential to know any time you did a disk swap, and even be told to keep various and seperate caches for each disk you might be using. DOS however, wants to see the words MS_DOS instead of an ID number there. Such a utility simply writes over the ID number MS_DOS, and you're in buissness.

Don't use this utility on origonal factory distribution disks such as games, or your origonal copy of NeoDesk!. It's perfect for back-ups and your data tank disks tho'. All it does is change a few bits so dumb arse DOS-WIN can tell the disk format is indeed compatable.

Also note...some versions of Norton Disk Doctor running on windows can detect and correct this problem. Maybe even other disk-fixing utilities PC side. If you have such an animal on your windows box...use an unimportant back-up disk and try it :)

Another option...
Get a null modem cable or adaptor ($5 tops at Radio Shack)...
With your favorite terminal programs on both machines, Initiate a standard batch dump using your favorite modem protocol (Zmodem, Ybatch, etc...)

Brian

It's usual to set the ID of a SCSI boot device to 0.

How you do that depends on how the drive has been wired into its case. A proper installation would have a thumbwheel or similar switch that will do that for you.

If there is no such switch then you can do the same using the ID setting jumper(s) on the actual drive - if you're lucky then there might be a little diagram showing what's what, or look on the manufacturer's web site.

For a SCSI ID of 0 there should be no jumpers fitted to the ID setting field (your present installation will have one jumper fitted).

Once you have all partitions on the desktop then save it.

--

Cheers

Derryck

Ok, this is getting interesting. There are no jumpers on the drive and
no other way that I can see to set the drive to ID 0. So I assume that
it is already set to ID 0. (which makes sense because I used to boot
from the HD and I haven't changed anything) Why then is the system
seeing this as ID 2? It makes no sense to me!

OK, I was finally able to get the thing working. I used HDPATCH program to create a SHDRIVER.SYS file on the C: drive that scans for all available drives. It now detects the hard drive on ID 2 and boots up.

Still don't know why drive is on ID 2, but I'm a happy camper right now.

Thanks for the help everyone, I appreciate it.

Get Uwe Seimet's HDDriver demo and run the ID check item from the Utility
program to double-check.

> from the HD and I haven't changed anything) Why then is the system
> seeing this as ID 2? It makes no sense to me!

Wierd!

>ID is set to 2. I don't know how to set it, but that is where it is
>and is probably the problem. There is nothing in ID 0 or 1. Should I
>set the ID to Zero and if so, how?

Most drives have a thumb-switch on the outside of the case to set the ID with a couple of push-buttons. These are connected to of 3 pairs of pins at the back of the drive mech. Some makers have saved a few pennies and omitted the thumb switch. In that case there are usually jumpers for the pins. These work in binary mode, so all jumpers off = 0, end one only =1, 2nd only = 2, 1st and 2nd = 3, 3rd only = 4 and so on. If your ID is 2, then probably only the second pair of pins are bridged. Pull off the ridge and all should be well. Alternatively, get a modern hard disk driver (like HDDRIVER or CBHD) which doesn't mind gaps.

LATER: Just read your later posting. I suspect that something - perhaps a loose bit of wire or solder - is shorting either the pins or a trace on the printed circuit board to make the ID 2. AS Derryck says, the demo version of HDDRUTIL will let you check what the device number is - click on Tools - Auto configuring (or Ctrl-A) and then Settings - Devices and Partitions (Ctrl-C) will show what devices have been found.

Regards, /Peter/

>

That's the same version that I am using.

As an experiment I did a quick install of XaAES and found
that Imagecopy would not start from the NEWFATFS partition
but at least it did not crash.

I have 5 Imagecopy binaries:

IC4PLUS.PRG	435,563
IMGC4.PRG	6,094
IMGC4CD.PRG	484,317
IMGC4S.PRG	403,831
IMGCOPY4.PRG	448,663

The first one is my normal choice but I found that IMGC4CD,
IMGC4S and IMGCOPY4 all seemed to function normally with
both XaAES and N_AES from NEWFATFS.

So my conclusion is that there is a bug in the IC4PLUS
version of Imagecopy that produces Opcode 224 error when
run from a NEWFATFS partition under N_AES and it is not
handled properly.

XaAES with NEWFATFS doesn't like this version of Imagecopy
either but handles it better.

I wonder what change was made to IC 4.2b2 that results in
the Opcode error ?

regards,

Peter

I've also noticed problems with long filenames. Double click a
long filename image and IC starts and opens it ok. However,
once IC is running that doesn't work. Strange.

Anyway, I am only trying to get NewFatFS to work without long
filenames, so that isn't the problem here. The FS of the image
files doesn't affect the operation of IC. IC just doesn't work
properly when it is located on a NewFatFS partition.

On my setup all the partitions except the C drive are NewFatFS or
ext2fs. ICb2plus is located on a NewFatFS. As long as the file names are
not too long I don't have problems with IC.
It's a pity IC isn't supported anymore. I'm convinced the problems

you've are caused by IC and not by NewFatFS.

Guess what...I like the loose wire/solder idea because the weirdest
thing happened. I've been running IDCHECK to confirm that the drive is

ID 2 even though I have no jumpers and it should be ID 0. When I boot I get a message on my screen:
ID 0 not responding
ID 1 not responding
ID 2 Seagate 157N
ID 3 not responding etc.

Then all of a sudden last night I got an error message, "YOUR OUTPUT DEVICE IS NOT RESPONDING". I kept getting it so I had to reboot. When I did I got the following:
ID 0 Seagate 157N
ID 1 not responding
ID 2 not responding
ID 3 not responding etc.

Somehow the hard drive reset itself back to ID 0! Now I run IDCHECK and it sees the hard drive in ID 0. Very weird! Perhaps something is on the blink and ready to go. Thankfully I've been able to back up all of my data to my PC, so if the thing finally goes I'll be OK.

I wonder what is going to happen next!

It helps if you have the same program on both machines so that it will
recognise the formatting. not many people have PC versions of Atari word
processors though.

Format a disk to IBM standard then save the file as doc or txt etc and see
which are useable on the PC. It depends what PC programs you have as to
which will work best. The chances are you may have to reformat the document
which may mean going through every line.

There was a word processor for Atari that would load the
most common Atari word processor files, and let you save
them as .rtf (rich text format) files. These can be read
in by word, and maintain the formatting.

How do you install PicDesk? And are .img and .gem pics the only graphics that
it can place on the desktop?

Thanks
Sam F.

Any clues as to which it was or what it's name is ?

I'm having a strange problem with the keyboard on my wife's STFM.
I replaced some of the cups that had become damaged and stopped
the Alt key and K and M from working. Everything seemed to be OK
after I reassembled the keyboard, but now I suddenly find that
[Left-Shift][L] is not producing anything at all although
[Left-Shift] anything else works fine, and [Right-Shift][L]
works OK.

Any ideas? Is it likely to be a trace problem? I do have a spare
keyboard I can use, but it would be nice to get the original
working properly!

Regards, /Peter/

First try the spare keyboard, if that works substitute parts from the faulty one until it stops working ;-)

I have a AdSCSI Micro ST adaptor, DMA cable and Bracket, but do not have the power cable. Does anyone know where I can get one and where the HD will be powered from? Can I use a regular power cable?

Thanks!
Tim

I'll try that when I get some time, but I can't imagine it's not a
problem within the keyboard, so it is almost bound to be fixed by
substituting it with another one. Re your suggestion, I don't
think there are many parts to substitute - apart perhaps from the
chip 'underneath'? I don't think it can lie in the 'mechanical'
part of the keys, since this should not affect just one key
combination.

That's definitely the place to start.

> think there are many parts to substitute - apart perhaps from the

I was thinking of the actual switches, but once you start cannabilising
parts...

> chip 'underneath'? I don't think it can lie in the 'mechanical'

That's basically a keyboard matrix to serial controller.

Hi, Peter!

>From your original posting I judge your problem really strange:
mechanically the keys must be ok, but there might be some kind of damage
that produces short circuits in your special combination.

DC> > chip 'underneath'? I don't think it can lie in the 'mechanical'
DC>
DC> That's basically a keyboard matrix to serial controller.

The only thing that might be useful to substitute is the keyboard
controller chip ("the chip underneath") IMHO.

Next step was to take the chip out of its socket and to check the keyboard matrix. With the keyboard schematics you could determine which pins of the controller chip identify the [L] and the right/left [Shift] and measure the resistance for the relevant combinations of key presses...

Regards,

Alexander

Hi Tim,

I had 2 of those and sold them both. I can tell you that the hard drive is powered from the power connector on the motherboard next to the power supply connector. I found from experience that the ST's power supply can't handle the drain from the hard drive. I even used a beefed up Best power supply and had the same symptoms (screen flicker, drive resets etc...). You may find a power connector at Best Electronics or B&C Computervisions.

The ICD Link II is a much better way to go IMHO. I have one on a mini tower with 5 hard drives, a cdrom and a Sysquest 200 meg drive that runs flawlessly.

Jon

There is probably a British eqivalent to General Cement Nickelplate solution. Or, silver will also work.

In that keyboard there is a mylar, with two conductive dots that are connected by a keypress. Those dots wear out.

I have excized that mylar, put a drop of Niclelplate on each conductive dot, very carefully, waited about 48 hours for this thick stuff to

completely dry, and put it all back together, and the dead button worked
again.

The only hard part is waiting long enough for complete drying.

Jim

Here is a little explanation as some persons didn't seem to understand the purpose of DMA memory2memory.

Thanks to the only answerer. Sadly he was talking of another concept: STe's sound DMA. I am talking of old ST's FD/HD DMA capabilities.

DMA is a chip that has some memory in it. 16 Bytes does it have.
Normally, in the Atari ST, it copies memory from main RAM into itself (buffering)
and out to Hard Disk or Floppy Disk.
And the other way round: from HD, FD into its buffer and out to main memory.
All this with a little cooperation from the 68000 processor.
I wish to use its buffer capabilities to copy from RAM into DMA chip, and then from DMA chip back to RAM. Without sending to FD or HD. This way I could spare processor time, while memory is being shifted.

thanks,
SoLo2

The following code does not work but gives the idea of what I am trying to do.

```
; D0.L=memory source
; D1.L=memory destination
DMATransfer
; XBIOS Traps:
```

```
; $2A DMARead, $2B DMAWrite
     movem.l d0-d1,-(sp)

I doubt that - I am not 100% sure, but the DMA chip probably arbitrates for the bus (by means of the MMU/GLUE chip, which contain part of the DMA logic) when it needs to transfer data, which means that the CPU will be stalled for that time (unless the CPU is running a "slow" operation that does not need bus access, like a mul/div instruction - however, these are rare in normal
~~~~~~~~~~~~~~~~~

code), so in the end, you probably do not gain much - expecially considering
the overhead needed to move just 16 bytes using your method.

cu

ATARI ANNIVERSARY EDITION
Stock: 25
Our Price: $11.79
Available at: http://www.rothline.com/shop/publisher.asp?PubID=ATARI

  Platform: Windows 95/98/Me
Publisher: ATARI (L)
Packaging: jewel case
Category: GAMES - ACTION, ARCADE & SHOOTERS
Item Code: ATARIANNIVED
Weight: 0.35 lbs

Description:
Atari�, the name synonymous with the video game revolution, presents
the ultimate arcade collection. 12 of the best classic Atari games
with all the fast action, sights and sounds you remember!
Includes:

Asteroids
Asteroids� Deluxe
Battlezone
Centipede

Crystal Castles
Gravitar
Millipede
Missile Command
Pong
Super Breakout
Tempest
Warlords
Each Atari title is faithfully reproduced down to the last detail, and each one is just as easy and fun to play.

System Requirements:

Windows 95/98/Me
Pentium 133MHz or higher
16 MB RAM No hard disk space required.
Game will play directly from game disc 4X Speed CD-ROM Drive
SVGA video card (2 MB or higher)
Windows 95/98/Me-compatible sound card
DirectX 5.0 (DirectX 7.0a included on CD)
indicates that device should be compatible with DirectX version 5.0 or higher.

Hi Alexander!

Thanks for that. In fact it has now started working again!
If the fault had persisted I would have investigated it further
with the KEYCODES.CPX by Mark Baines, which shows both the scan
code and ASCII code for any key or combination pressed.

What puzles me is that since the Left-Shift key worked with all
others apart from 'L', and 'L' worked unshifted and with
Right-Shift, I couldn't see where the fault could lie. The suspect
is perhaps the matrix decoder, but even so.... The Left-Shift
switch surely only has a single trace going to the decoder, and
the same for the 'L' key.

Regards, /Peter/

First of all I'm not sure there is a separate Mylar in the normal
ST/Falcon keyboards - it all seems to be printed on the circuit
board. I suppose one could re-silver/nickel even that.

But as I said elsewhere - if it was the contact, surely it would
affect all combinations, i.e. either the Left-Shift wouldn't work
with any keys (which it did!), or 'L' wouldn't work - but it did
unshifted and with Right-Shift!

Thanks Jon.

I got it working finally. I had a scrap 1040 PS that I stole the connector

```
from!  I hooked up a really slim SCSI Quantum Trailblazer 810MB drive and
she seems to be working fine...  Hopefully I won't have a power issue....

Tim

I wish you good luck.   I read somewhere that some of the mega's had a
"good" power supply and didn't have the issues I had with mine.

I need some input on this.

First, let me describe the system:

Mega ST2 upgraded to 4 megs ram

Extra Mega ST4 for parts with working motherboard/PS
ICD Adspeed 8/16 processor upgrade
Megafile 30
Megafile 60
Mono Monitor
Pristine SLM804 laser printer (w/new drum and 3 toners $200)

This was Atari's DTP system with 2 added hard drives.

Due to my anal attitude when buying this stuff, there is no yellowing anywhere and all this stuff works like a charm.   What I am looking for is a realistic value on this stuff.   If there are any offers also, I will entertain them.

Thanks

I've considered just buying a nice flight case...brief-case size/style...
These cases are really common for camera equipment, small audio kit, etc...
Mount a nice TFT screen in the lid...
Mount the Falcon's MB in the bottom...
Cut out a face plate from lucite or plywood or somethin' to drill out a 'panel' for port and drive access, etc...and go with an external keyboard on a wire...should be plenty of room in the case to just stuff they KB inside, close, and carry.

You could also do something similar with a 2 to 5 space composite/plastic flight case/rack. Just mount the MB on a rack/plate...do the same with your disk drives and such...get an external keyboard solution. It'd be a fairly open air design that you just take off the end caps when ya need inside. If ya really wanted...could make cut outs in the case to mount drives and cable extensions and the like.

You can also do alot with a sheet of lucite, plexi-glass, or plywood, a package of screws, and some quality glue :)

Also check out ebay for junk rack-mounted equipment that no longer works. Old commercial grade 3/4" video machines for instance. You might be surprised how many boxes there are out there on the cheap that are plenty big to house your Falcon without lots of hacks and fixes. I can't even begin to count all the doodads made for TV and Radio stations that were sold mounted in a very basic 19" rack-fitted aluminium box, or on a simple rack mountable plate that ya just slid in a rack somewhere and forgot about...sometimes I see such things being hocked on eBay for pennies. I'd suggest things with no front and back at all, or where the front and back are easily removed and replaced by your own cut-outs. Again, go with lucite or plexiglass to cut out your front and back...with all the holes ya want/need for drives, ports, switches, lights, and so on.

From there all you need is a cartridge extender ribbon, and similar extension cords for the midi and joystick ports. Not so hard to buy, make, or live without really.

Unleash your imagination on this........

Just some ideas, that with some thought, and fairly enexpensive materials and tools should be easy enough.

Brian

Hi there!
I am thinking of buying a new SCSI HD for my Falcon, but it's a very long time I bought the actual one, so I can't remember what king of specs I have

to look for: SCSI 1, 2 ,ultra, parity, switches, max size, and so on. Will
you guys please helpe me?
Thanks

Any SCSI drive (SCSI-2 or SCSI-3) is fine, as long as it has an 8 bit
SCSI bus. With modern 16 bit bus width drives an adapter is required.
These adapters are not Atari-specific, so it should not be a problem get
get one. There is no limit for the drive size.

Hi,

By using "makedisk" you can create an image file. The emulator will be able to read this image file. You have to pay attention : makedisk can only work in MS-DOS (not MS-DOS prompt, or MS-DOS mode in windows)

You don't really need an emulator to read ST-formatted floppies. Search for a program called "GEM Explorer", it's a Windows app that can read ST-formatted disks.

But that's just the reading floppies part. :) The word processor you mentioned is probably 1st Word Plus, and I don't think there is a PC app that can view those files. But there are probably lots of people here who have an ST and maybe even WordPlus so they can convert your files to ascii, once you copied them to your PC so you can mail them. :)

Maurits.

Peter's answer already contained some hints on what to keep in mind when using the compatibility mode, so this might help.

I do not find you in my list of registered users, by the way. Can you
plase send me the serial number of your HDDRIVER? Thanks.

Best regards, Uwe

> for some sierra games I believe?

Yes it was much more flexable when it came to disks and their formats but it
was still based on tracks and sectors, it was good but not that good
(Fastcopy Pro had 1.44 support too). I have most of the hardware copy stuff
that came out (Blitz Turbo (both versions), Synchro Express, etc) and they
were better but still could not do 100% of disks.

Synchro Express (the best) spent hours copying one disk, hmmm "syncing"
each drive to each other than then doing multiple reads and writes to the

disk to try and work, it was supposed to be a "mirror image" of the orriginal as apposed to a "data image" of the orriginal.

A good example is Golden Axe (the orriginal, not some crack or one from a box set), this had a good "physical" protection and none of the above managed to copy it.

PCs are just sh!te at disk asscess, most of them you will be lucky to get to work at more than 80 tracks, the drives, drivers and controllers are very simply and cheap. Best to go and find a crack.

Elliot.

Hi folks

I updated my Atari site hardware/software so if there is anything anyone might be interested in you can let me know. I still have some items not yet on the site.

http://atariweb.paraisocz.com

Thanks
dave

I have it on paper as part of Falcon Service Manual, but could scan it
in mono img file if you need it.

Hi all,

I managed to get hold of what I believe to be a 16mhz accelerator card for my Mega ST1. It came with a disk, and a german manual, on the front of which it says HBS 640.

In the manual there are chapter headers for 260 &520ST, Mega St and also 1040ST.

As i said, the model I believe I had was for the mega ST, but taking the machine apart, there doesnt seem anywhere obvious where the card will fit (it won't go in the expansion slot like I thought it would)

Does anyone know where I can get some assistance in fitting this, or where I may find a manul in english that may shed some light onit (or tell me if it's the 260.520.1040 model (which will therefore be of no use as I don't own one)

Looking at the set of pins on the back of it, it appears it goes where the biggest chip on the mother board is, but as I don't know wether it goes inplace of the chip, on top of the chip or whatever (as it happens, I currently have a small IC board soldered to the center 7 pins on that particular chip, which i think is the clock.)

Any light shedding, gratefully accepted.

Rob

P.S. Among the german spiel, it does mention 16mhz, but also does mention something about 25mhz, which would be rather nice.

hi,
can anyone give me some info on TOS 2.05

I have been informed that it was originally shipped in the Mega STe

can anyone tell me the bug fixes that were made to it in 2.06?

is it a realistic proposition to upgrade my 1040Ste to 2.05?
i also have a mega Ste (german TOS) that i could replace with this English version..??

cheers

Yes the MegaSTE was shipped with 2.05, it was very buggy. The easy way to tell is that it does not display the Atari logo or ram test on boot up. A note from http://saint.atari.org/html/doc/tosinfo.html

Mega STE TOS (TOS 2.05)

TOS 2.05 is the version of TOS currently shipping in the Mega STE.

Formats : 2 chip ROMs
Machines : MEGA STE
Utilities : CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes : This version is only available in the Mega STE. It isn't available for upgrading.

It seems it was specific to the MegaSTE, I have heard of hard drive problems and the like. TOS 2.06 kicks its butt, use that instead. I had it in my second Mega, and pulled those chips faster than you could blink.

Mark

The HBS series of accelerators replace the CPU. I'm not sure what is needed, but you may need to socket your CPU, the 68000 and place the HBS in the socket. I'm getting an HBS 240 soon. It's 16Mhz, so your HBS 640 may be faster , like 24Mhz or something.

The little circuit you said about might be the FPU patch on top of the CPU. Not sure what you would do with that, remove it and the FPU maybe as the HBS has a socket for FPU AFAIK.

Hi Lyndon, I'll take a couple of photo's and post them on, see what
you think. (Personally not brave enough to go unsoldering the CPU and
re placing it with this one _ I had enough trouble building a moniter
cable)

Yep, my mistake, it is the Blitter patch. I knew it was one of the co-processors.

Lots and lots of bugs, but the most important improvement between TOS
2.05 and 2.06 is support of HD-floppies.

Also the Mega STes shipped with TOS 2.06 were much prettier to look at
but I guess that's not important in this case. ;)

Maurits.

hi, I have just got hold of a mega ste,
it appears that it's only got a 80MB hard drive inside(I have not opened it
up yet)
could someone tell me what type of hard drive this would be?
is it ASCI or SCSI?

could I replace it with a standard scsi hard drive...? or is it the same
type as the mega file external hard drives?
any help
cheers

thanks for your help...

i have just got hold of a mega ste, but it has that 2.05 (german)tos..
someone on ebay was selling ses of 2.05 (US) rom chips....

so i guess i should only bother with 2.06 then..?

alsdo.....is it possible to load tos from a floppy?
i have copies of all the atari tos on disk as '.img' files...
what is that all about?
any ideas???

just to let you know,
i have managed to find a until called 'select tos'
and it works a treat...

that little mega ste was auto loading tos 1.04!!!...

not any more.....!!!

It's a scsi drive.

> could I replace it with a standard scsi hard drive...? or is it the same

Actually, some of the megafiles also have scsi drives inside, at least the megafile 44 has. :)

Yes you can replace it with a standard scsi drive, but as time progresses there are more and more scsi drives out there that don't work with classic Ataris. Try the closest one you can find to SCSI-1 or SCSI-2, and make sure it's not an LVD (low-voltage differential) drive.

Good luck :)

Maurits.

Also note that the MegaSTE's SCSI adapter cannot access more than 1 GB,
at least not without a hardware modification. So you won't be able to
use more than 1 GB even with drives having a higher capacity.

Hmm why is that I wonder? So the TT has a different, better SCSI
controller? In your opinion is the TT SCSI pretty descent?

Tim

If this drive works...
Use it for a while...
I think you'll find that 80meg on an STe goes a LONG way!
We're talking more than 80 DD Disks of data here...

In all my years of ST use...the only thing I ever ran into that really needed a bigger disk was burning CD-ROMS to capasity (700mb) and making big 16 bit sample libraries for my Peavey SP.

To get the most out of a drive this size, use smaller partitions sizes with the smallest sector sizes you can manage. See, the least amount of hard drive space any file can consume is a full sector...so even if a file is only a couple bytes, it will take a full sector.

I have an assortment of 4.3Gb 50pin drives from an ancient Digital server
I'm yet to try out in my TT.

Only issue is that they don't have on board termination they require an
external one, which means I'll need a new scsi cable, and by default, they
don't spin up unless asked to, this feature does not work on the TT, but
there's always a jumper to override that.

I'll document my discoveries. I also have a 1 gig drive I'll try if I cant
get the full 4.3 gig to recognize.

So the TT SCSI controller does NOT have termination for the external port?
I had mine running with no external terminator and it works fine. (With no devices on the port) Then I also added a Zip-100 and External HD and terminated the end and it seemed to work fine!

The TT and the Falcon have a real, full-featured SCSI controller, the
MegaSTE just has an adapter that converts from SCSI to ACSI. This is not
as powerful as real SCSI and there are some limitations.

thats pretty normal. dont know how it works, but the external connector only
needs termination when theres something connected to it.

hi,
more questions about my newly purchased Mega STE
I have opened the case to check out the hard drive... but I also noticed
what looks like room for me to place another CPU on the motherboard..
is this correct, can I put another CPU and run both CPU's together?
what advantages / disadvantages would result from me doing this?
any ideas?
cheers

hi,
yes I understand that, but my problem is I am going to be running cubase and
other music software,
I will be storing a vast quantity of music data on this hard drive..

on a similar note...
I am in the process of backing up the original software, and after I have
done this I want to reformat the hard drive.. how would I get round this?

would I need to use a special 'format' program?

TT and MSTe may look the same but they're very different animals.

The internal MSTe Atari host adaptor is like no other - all SCSI devices
have to be set to SCSI 0, with the host adaptor itself determining the SCSI
ID. (It's physically awkward\ugly to chain devices off the internal HA, but
this even applies if you're hanging another drive off the DMA port and want
to boot from the external as SCSI 0).

The TT is itself a SCSI device. No host adaptor is used - it's a direct
connection to the MB.

Reformatting is only required if a drive has bad sectors. Otherwise
repartitioning is all you need. Your hard disk driver should include
software for doing all this.

Hallo everybody

I'm new in the Atariworld, and someone has given me an Atari ST with a laserprinter, without any documentation, I need a scan of the usersmanual and the driverdisks.
Who can help me?
Thanks

Well, for manuals, Best Electronics has manuals, and takes PayPal.

The owners manual is listed at $15 USD, the Service Manual is listed at
$50, and they have schematics of some of the boards. They can also sell
you the emulator shipped with some machines. The website is

best-electronics-ca.com.

The driver software can also be found by FTP to chapelie.rma.ca.be, under Utilities and I think, Diablo. It is a complete set of files put together from at least two different distributions. You probably do not need anything else. The connectors only go together one way.

You will find that most of the people on this group are firmly opposed to something called piracy. Probably nobody will scan a manual when that manual is still available from somebody supporting the Atari World.

Jim

No, no, the small IC board on top of the CPU (there is just one 7474 on it)
was supposed to fix problems with a batch of faulty blitter chips. It
slightly modifies the timing of bus arbitration signals. Some Megas
may very well work without it, depending on the version of the blitter
(it is possible that you may have to reconnect a trace on the motherboard
if you remove this piggyback board, I don't remember exaclty anymore).

Mega1 does not have a built in provision for the FP; neither the socket
for the FPU itself, nor the address decoder.

Yes, and is possible that an address decoder chip for the math-coprocessor
is also missing then (maybe there is another, smaller, empty socket on
the board?); there was no need to install it if the FPU itself was not there...
the decoder can be made using a PAL or a GAL, or even a couple of
standard TTLs on a small board...

hi,
I use a little program called Diamond Format v2.2 on my Atari,
it lets you format floppy's on the Atari and it writes a MS-DOS compatible
boot sector
if you like..
this means I can open any Atari floppy on my pc..
I hope this helps..

hi,
can anyone recommend a compatible scsi hard drive for my Atari mega ste or mega4

the mega4 is about to have a scsi adapter installed (make unknown as yet) so i was hoping for a list of make / models that should work ok..

I have manage to get the mega4 to run TOS 2.06 (the same as my mega ste)

I now understand that I can't get anything above 1gb...
any ideas?
cheers

All SCSI hard drives which conform to SCSI I and SCSI II should work fine. The only thing with the Atari is an adapter is definitely needed. On my Mega 4 I have an internal Adscsi adapter which allows a large drive to be attached. I have no docs for the device, but, everything I've connected to it has been seen without problems. The ST/e I have is running the ICD Link II adapter. Currently that machine is running a 4.55 gig IBM drive without any problems. Also there is a CD Rom attached to that chain.

It is hit or miss with drives on these machines. Some work, others do not. I can tell you that I have pulled my share of hair from my head trying a lot of combinations.

Good Luck!
Jon

I've had very good luck with Seagate drives, dating way back to the MFM/RLL stuff to some fairly modern drives such as the Barracuda regular and wide(with an adaptor) types. What I like about the Seagate drives is that they don't cut corners and pinch pennys when building a drive by doing things like not offering jumper settings, backwards compatability, and sticking with the SCSI standards in general. They've also come with some of the best warrantys and service policies of any drives on the market...so the few extra bucks has always been well worth it. In short, I've yet to own a SCSI I or II Seagate drive that doesn't work with any of my Atari ST-STacy-STe-Falcon setups. I've yet to see a Seagate drive that didn't meet the standards, while offering tons of options for oddball hosts and strange combinations that often come into play when building large or small SCSI arrays. I.E. you can enable or disable parity, provide term-power to the bus or not, get term-power from a variety of sources, the ability to enable or disable things like unit attention messages, target-initiation, caches, adjust the LUN address, tinker with start-up delays and various sleep modes, and more, via jumpers, dip switches, software control, or a combination of these. It's rare you'll find a Seagate drive that can't be used with pretty much any SCSI or Quazi SCSI host ever made. It may take

tweaking, but Seagate drives are very very good about being configurable to coexist in just about any SCSI array imaginable.
I have several Seagate drives made way back in 1984 that have run nearly every day since, and STILL WORK with no bad sectors (knock on wood).

Syquest is another good drive in terms of Atari compatabilty. If you're pretty rough on your kit...you may want to avoid these tho', they don't like shock and knocks much from my experiences. On the other hand...if your kit stays in one place and you take very good care of things, and keep a normal temperature/humidity that's pretty constant...you'll get years and years of faithful service from Syquest products.

Quantam makes good drives, but I understand there are a few that require SCSI arbitration or they just plain refuse to work. I've also 'heard' some also insist on Unit Attention messages that TOS 1.00 can't stand. I've only owned one myself and it's an old 85mb SCSI I type in an Amiga 2000 and has tons of hours on it. Never tried it in an Atari, but No complaints over this drive :)

I've not had very good luck with Western Digital SCSI drives (For Atair or otherwise). They were cheap and damn fast...but they didn't make many SCSI drives, didn't support them very well when they did, and the 2 I had didn't outlive their warranty. The first BAD thing about the drive, was that parity could not be disabled...that's a problem for alot of the early SCSI hosts made for ST machines. The first one I had was an A/V model for my Falcon, and it died after 2 years, I sent it back to them (three year warranty--Seagate SCSI offers five), they kept it nearly a year, sent me a replacement (most likely refurbished) and it didn't last a year. On the other hand...I've had some very fine WD IDE drives, and they get better and better at making them each year.

Brian

Hello,

If it's the same as for the Mega ST, you
need a 16Mhz clock signal for the floppy.

I have a PCB scheme and wiring diagram to add such device.

Oh, and classic PC drives are set to "drive select 1" by default.
You need to solder a jumper to set it to "drive select 0".

Hope this will help.

Pierre

Does anyone have this drive working with the ST? What jumper setting need to be set?

Also does this drive fit w/o hacking in the newer STe/TT faceplates?

Thanks
Tim

Hi Martin, you dont need to worry about extra circuits or anything like that. All MegaSTE's are capable of running a 1.44 straight out of the box. All you need to do is switch dip switch 7 (from memory) on the bank of dip switchs near the TOS roms and plug in a drive set to D0 not D1. The dip switch just sets a cookie for TOS to allow 1.44 Mb formatting from the desktop. So it is no essential. Some drives like the Teacs are very good, you just change a solder link on the drive to set D0. I have a MegaSTE that I milled the front out and modified the mounting brackets. So any PC drive will fit and still look good. The only real hassle is with the floppy controller chip. Only the Ajax was rated at 16Mhz. The WD 1772 02-02 which you probably have is only rated to 8Mhz so is theoretically incapable of working. In practice I have found they work just fine tho. A few people have had problems with over clocking the WD1772 02-02, I would wager that some WILL fail. But as I said mine have all been fine. I have set up 4 STFM's and a MegaSTE with the WD chip no problems thus far. Would have to say the usual disclaimer applies tho..........

Mark

Hi All,

Is there a way to recover an accidentally formatted internal ide HDD
in my Falcon? It is a Seagate 60MB hdd.

Thanks.

Did you just re-partition it or did you format it? If you actually
(low-level) formatted the drive there is no way. Otherwise tools like
DISKUS (German only) can help to recover the data.

in rare cases you can recover... like if you repartition but dont
format... (and you wrote down your partition tables) if you used a
hard disk formatting utility then your data has gone i'm afraid. You
DO have backups dont you?

Sorry if I was not clear. I don't want to recover data. I was read, that these old hdds contain hardware specific information on the disk itself. So if I format them then these information will be lost. I think that is what happened in my case. I formatted the hdd and I am not able to create a partition it.

Might anyone know the current wherabouts or occupation of Stuart Smith,
author of "Return of Heracles," et al?  Even just a working email address
would be great.

Someone I know is trying to find him in order to re-obtain a license to
some of his games.

Hi, Thomas!

TB> I would like to add a cdrom to my mega ste..other then the connections
TB> will any scsi cdrom work or do i need to look for a paticular
TB> brand/type.thanks for the help

Almost any SCSI cdrom will work (at least for data cds, audio extraction may not work for some really old models). For CD writers you should have a look at the compatibility lists of the (commercial) software you plan to use.

Drivers for reading cdroms are f.ex. Metados, Spin, Extendos (see lp's posting).

Regards,

Alexander

I have used the Extendos Pro driver with a d2 CD-ROM drive and a
Syquest EZ-flyer, and it has worked just fine.

No, the Mega STE is ready for High Density and the only one thing you have to do ist change the position of a dip-switch named SW8 and located close to the ROMs : 7= Enable HD-Drive.

The main problem is the fitting of a PC Floppy disk because the front side does not fit the original Mega STE case. You need an Epson SMD-300 to replace your Epson SMD-380 floppy and from which you can use the front plastic case if you got it from a PC or a Falcon. The SMD-300 is nowadays really hard to find but it happened that I luckily found one 6 months ago in a very old 386 PC from a friend and could make a clean installation in my Mega STE.

An other solution which I used at first is following :
- enable the HD switch.
- keep the internal floppy still operating fine 720kB floppies.
- connect any PC 1.44MB floopy on the external floppy connector of the Mega STE and operate it as a B drive. It is possible with a minimum of soldering at the floppies pins to make the external drive A: and internal as B: (swapping pins 12 & 13)

Still the special DIN connector might be difficult to find except if you can get one of the non-Atari external 720kB floppies that existed and that you would replace with a 1.44MB.

Fred
PS: I forgot to mention that you would anyway have to swap some pins at
the PC 1.44MB floppy if this latter does not have a drive select to drive 0.

it depends on the driver software you plan to use - e.g extendos has list of
supported cds as well as metados etc...
check the list first and then find a suitable drive :)

hi,
is it at all possible to adapt the scsi controller in the Mega Ste, to work in a Mega ST4?

basically I have purchased a Mega STe scsi controller (yet to arrive in the post) by mistake..
I wanted a scsi controller for my Mega ST4...

has anyone managed to make this work??

No.

The Mega4 does not have a VME bus, only the TT030 and MegaSTE do.

I would imagine if you reverse engineered the VME SCSI card you may be able
to get it to work. ;)

T> The Mega4 does not have a VME bus, only the TT030 and MegaSTE do.

Does the MSTe-SCSI-Controller plug in the VME bus?
I'd expect it to be hooked on the ACSI bus, as any 3rd party "host
adapter".

T> I would imagine if you reverse engineered the VME SCSI card you may be
T> able to get it to work. ;)

I remember to have seen such a MSTe-SCSI-Controller as a small PCB (maybe
10 x 5 cm) placed at the back end of the HD-slot of the MSTe. Because of
this I am surprised about a "VME SCSI card". Every day something new ;-)

Regards,

Alexander

I doubt this is a VME host.

STacy and MegaSTe computers have a header to plug on an internal SCSI host.
This is most likely the Atari CI0356I host.
If it is, send it back if you can!
Why?
Even if you do find a way to get it working in a Mega:

1. It only supports 1 device under 1gig.
2. No parity support.
3. Oddball termination requirements so it's best to use only one very short cable, no termination.

There is a hack to make this thing run 2 drives.
There is also a hack to give it a parity genorator.
Both hacks are pretty involved.

If it turns out you've managed to order a Link97 host for the MegaSTe....PLEASE Email me...
I'll buy it from you and help you find a suitable host for a Mega.

Brian

oh,

in that case I am going to replace the internal's of my rack mounted Meg ST4 with my spare Mega STE (and make a rack mounted Mega STE!!)

as I am going to have more space in the rack unit, can I connect more scsi devices to the scsi hard drive inside the Mega STE?
I have another cable with more scsi connectors on it...and a power

splitter... I was thinking of connecting either a jaz or zip drive and a CD
rom....

hi,
i have just tried to swap my Mega STe's floppy drive with a standard 14.4
(well i tried 5 different PC floppy drives..)
and none of them worked..
i found the switches numbered 1 to 8 (all of these were set to 'off 'apart
from number 7 when i opened the case, so i did not alter the settings)
but whenever i connected a PC floppy drive and then booted the Mega STe, it
would not recognise the floppy..

i noted that the ribbon cable is flat (unlike the PC floppt cable, which has
a twist in it).. is this my problem?
should i also use a PC floppy ribbon?

it's strange because the floppy works fine in a PC but not the atari...

any ideas???

Yup, you need to set the drive to ds0. 99.9% of PC floppies are set to ds1.
Depending on the model of drive it could be either a jumper or a solder pad.
The TEAC drives use a very obvious solder pad on the later models.

Mark

i have played around wit ha few jumper settings... but still no luck...

but in the process, i managed to format a 1.44 floppy with my original Mega STE floppy drive...
(is that really possible??)
it looks ok...

i'm going to play around a bit more.. but did the Mega STE have an Atari looking 1.44 floppy drive...
could it have come from another Atari??? TT maybe???

Yes, it is an Epson SMD-300 is it? They are 1.44. Sounds like you are in
business. Mine was the same, it had a 1.44 and the dip switch was off. This
just means that you didn't have the ability to format from the desktop.

hi,
does anyone know much about this product??

I have just received in the post, two scsi / dma cables...

Link 96 and Link '97... they just look like a short length of scsi cable with a centronics male connector at one end and an Atari DMA connector at the other end.... no software was supplied (only a page of instructions in German!!)

do I need software to use these? can anyone help ???

> does anyone know much about this product??

Yeah...they are DMA to SCSI hosts. Most SCSI type I or II drives will work fine on them. Many SCSI III drives (wide SCSI) will also work with a proper adaptor that terminates the high (unused) bytes. These are pretty much plug and play, the most common catch people experience with these is that they need Termination power to operate (Unless you have the 97+/Zip model). The way you can tell if your Link is not getting power, is that your ST will hang when you try to turn it on.

In this case, have some device on your SCSI bus 'provide' termination power. This is usually done via jumper settings.

Finally, terminate the last device in the chain...either with drive jumpers/termination packs, or with an external termination block.

Yes, you do need software.

Some Hard Driver Choices:

HDDriver (Still supported, fast, BG-DMA w/MagiC, DOS partions, and more....)
AHDI
ICD Pro
HUSHI
SCSI Tools
Cecile

Some CDRom Drivers:

ExtenDOS Gold
Spin
MetaDOS

Ethernet Driver:
For some Dynalink models....Anodyne has a free STing driver.

Scanner Drivers:

I forget the names of the packages, but Nima did drivers for HP, Mustek, and some other SCSI based flat bed Scanners.....

SMIDI (For sample exchange via SCSI connection...I.E. Peavey DPM SP)

Avalon
Zero X

thanks..
I have AHDI v5.00 on my mega STE, will that be ok?

on my Mega ST I only have an earlier version.. but this Atari already has a MegaFile 60 attached...
will this cause problems?

will I have to daisychain the scsi drive after the MegaFile on the ST?
cheers

john

Well, if both of them are external versions use them to connect SCSI devices
to ST series of computer...
Any driver would do, but you should try some newer drivers...
They are just plug n play :)

Also note that old drivers like AHDI cannot exploit special features of
these adapters, in particular accessing more than the first GByte of a
drive with a capacity of more than 1 GByte. Or sending any SCSI command,
which is useful for diagnostic and/or repair work.

> I have AHDI v5.00 on my mega STE, will that be ok?

It should work.
The thing with AHDI is that you're likely to find that if you connect any device
larger than 1gig, you may have to 'short stoke' the drive it to use it...you'll
only get the first gig use out of it! I'm not 'sure' about this...the STE has a
later TOS than my Mega, so I could be wrong. Try it and see :)

Another thing with AHDI, is that devices that insist on arbitration most likely will not work. This may not be a problem for you.

If you're interested in running later MiNT kernels...with EXT2 type partitions for instance...AHDI lacks protocols you'll need.

Finally, AHDI isn't going to support the SCSI Driver protocol that's common with non hard drive type SCSI devices.

AHDI just might fit all your needs...if not...look into HDDriver. You'll find the range of SCSI devices you can use multipy by ten fold with these drivers.

> on my Mega ST I only have an earlier version.. but this Atari already has a
> MegaFile 60 attached...
> will this cause problems?

No, you can use a Megafile 60 along side your Link 96/97. The older versions of AHDI have a limited set of drive types you can format/partiton/etc...so you might want to update this if you plan to use drives not in the list. If your hard drive is already formatted and partitioned within the proper limits of your TOS version...there is a good chance the existing drivers on your Mega will see them just fine. If not, plug the Megafile into your STe, uninstall the the boot sector, and reinstall it with AHDI 5. Now move it back to your Mega, and all should be just spiffy.

I have a Mega 4 with a Megafile 60. Sometimes I have my Link 97 SCSI array hooked to this machine, and sometimes I don't. I also have a STacy with an internal hard drive (which works quite similar to a megafile). Here's how I set things up for minimal fuss so I can move the Link 97 from machine to machine...plug and play.

I use HDDriver 8 on my ST machines, and HDDriver 7.93 on my Falcon. I have my Megafile set to ID 1. I have my STacy's internal host set to ID 2. I used HDUTIL to write a boot sector on the Megafile that has the "ICD/Link 97/98" and FAST ASCI options disabled.

My external Link97/SCSI array has a hard drive set to ID 0, and a CD-ROM drive in it.
On this hard drive, I had HDDriver set a boot sector that has the Link 97 and Fast ASCI options enabled.

When the Atari boots...it scans for DMA devices from 0 to 7 in order, the first one it finds with a boot sector, that's the one it will boot from. So....if I only have my Megafile 60 pluged in...the ST boots from that. If I have the Link 97 plugged in as well...then it boots from drive 0. Note with HDdriver, you can change this scanning order, or even specifiy machines on a certian ID bood from a certian device/partition (and more).

The main thing to remember here, when using a Megafile alongside a link 96/97...is to take care that whatever ID the Megafile is using...leave open with your Link 97 SCSI array! I.E. If your megafile is set to use ID 0, then make sure no device on the Link 97 is also using ID 0.

With this set-up...I can very easily move any of these devices from ST to ST to Falcon to PC. If I had two Link 97 hosts...I could even put both ST machines on the same SCSI BUS thanks to HDDriver allowing you a plethora of booting and other nice options.

Most often, this is what I use:
Mega 4 (Link set to ID 2 using HDDriver) > Megafile 60 (ID1) > Link 97 > SCSI HD (ID0) > SCSI CD (ID3) > SCSI HD (ID4) > SCSI ZIP (ID 5) > Peavey SP (ID 6) > Falcon (ID 7).

When I move this to my STacy...I change the STacy's arbitration ID to 1 since I have the Internal hard drive set to use 2, and usually leave the Megafile off the chain.

In either case...I can use all these SCSI devices with my Falcon or ST at the same time (tho' you should avoid at all costs having both machines write to a like partition in the same session). Sometimes I replace the Zip drive with an Ethernet device or another SMIDI Sampler.

Seeing as you have 2 or more Atari machines...and a pair of Link hosts...
I suggest that you might buy two copies of HDDriver and link all this stuff together on one common SCSI chain ;) Cool ain't it?

> will I have to daisychain the scsi drive after the MegaFile on the ST?
> cheers

Yes...you'll just hook the Link 97 DMA cable into the Megafile, then to the SCSI stuff of your choice.

Brian

You are right. The problem is not TOS, but AHDI. AHDI cannot access more
than the first GByte of a drive connected to the ACSI or SCSI bus.

> Another thing with AHDI, is that devices that insist on arbitration most likely
> will not work. This may not be a problem for you.

For the ACSI bus this is handled by the LINK96/97 hardware, so the
driver is not important in this case.

Just as a follow up I succesfully replaced my 720k drive with a Epson
SMD-300 (340) 1.44m drive and it works perfectly! No AJAX chip needed! I

have TOS 3.06 also. :)

All I had to do was set DS0 on the drive and swapped face plates and
installed it in the case. No hacking required!

Tim

hi,
I have now managed to connect a $GB IBM scsi hard drive to my Mega STe with
a Link '97 cable..
the scsi ID of the new hard drive is 1
when I boot the Mega Ste, it can see the new hard drive.

the problem is... I need to format this drive.. it's not showing up on the
desktop..
I have a program called SFS format, which I will need to run my ADAPII
harddrive recording software..
but it seems to be having a problem....

but I think this is down to the fact that the drive is not formatted...
what software do I need to format this drive ?

at one point it did show up as a 4GB partition on the host drive (0) as H:

any ideas???
cheers

HDDRIVER, for instance. But formatting is only required if the drive has bad sectors. Otherwise partitioning is sufficient.

Anyone know where I can find an Editor/Librarian software package for the JLCooper MSB Plus? It's called MSB+ Remote and was made for the Atari and the Macintosh computers.

Will be highly appreciated.

Thanks
Dave

Email them on sales@jlcooper.com or service@jlcooper.com and ask.
I'm sure they have a copy lying around. It'd be stupid to throw it away.
It's a piece of history and some people, like you, are still using it.

(Sorry this is OT but I wanted to ad to the hard core folks who might be interested in this)

I am selling a vintage computer collection that I have been working on for almost 10 years. It contains many computers from many different companies that span the late '70s, 80�s, and early '90s. All systems come with original software, manuals, books, magazines, videos, keyboards, monitors, mice, etc...

I have also tried to collect very interesting and rare items including an original 1978 Apple II Reference Book from Apple, twin Macintosh 512ks with some fantastic accessories, a complete TRS-80 Pocket II Computer, and many other items.

I could not possibly list everything that I have so I created an entire web site (not a page) so you can browse through the pictures, background, statistics, and other information. I have treated these systems with the greatest care and I think you�ll see that when you browse through the gallery.

I have been approached by many people to split up the collection but I would rather not. My hope is that this collection will be purchased by another collector (new or established) or a computer museum and added to their history of digital technology.

If the winner wants to do shipping then they will be responsible for paying for it, however, it might be better to arrange for the winner to pickup the collection. We can work something out.

If you're a fan of Commodore, Apple, Macintosh, Amiga, TRS-80, Timex, etc...you'll at least want to browse my pages for a trip down memory lane.

I'm asking: $580.00 OBO

If you have any questions, please do not hesitate to ask.

You can go to http://www.mmhart.com/Collection.htm for more information, pictures, etc...

Thanks!

Hi all. I sold my atar 1040 ST 2 years ago... and the fellow who bought it didn't grab the ICD FA*ST Hard Drive Case.

ICD, Inc.
1220 Rock Street
Rockford, IL 61101-1437

I bought this new in 1993 with a small SCSI hard drive for $700 Canadian... (imagine)

This was by far the greatest addition to my Atari... fast access to all my programs and it made making music on the machine a dream. Kinda wish Atari's music machines would have kept going.

I'm wanting this to go to a good home so... I'm open to offers. The controller card alone was $100 usd the last time it was sold.

The last version of AdSCSI 6.5.5 Software is available for download.
http://www.icd.com/atari/adscsi.zip

So make me an offer. I would even consider trades for older drum machines or tone modules.... then again cash is always nice.

:o)

Happy New year

I've a STacy 4 here that's acting really strange and I'm clueless what to try now.

I found a bad 30k resister trimmer on the internal power supply that refused to lock in to a sensable voltage and replaced that. Now I can get a rock solid 5 and 12 volt adjustment, but at this point the display only shows a grid like pattern on cold boot, or a solid blue display on warm boot. With an SM124 monitor connected I see the STacy is computing just fine...the floppy works and so on.

Here's the odd thing....
If I turn the 12v trimmer down as low as it will go, around 7v, and crank the 5v trimmer up as high as it will go, around 8v...I get a nice clear display on the LCD. I'm really weary about running the STacy in this state, as I'm not sure that kind of voltage is very good for the floppy drive, and I doubt a hard drive

will even spin up like this...if it does manage to spin up I doubt it would have much of a life span.

This is really blowin' my mind!
Any ideas?

Oh, I'm also wondering what the third trimmer on the internal power supply does.

Thanks,
Brian

There was a card called the MagnumST that could do 14MB, it was from Germany, check the ebay.de site, you can get one real cheap there. ST and amiga stuff sells way cheap in germany, compared to the US, where we love to over bid on vintage grear. LOL

Hi:
Sorry, but I think MagnumST is not compatible with STE.
Someone can confirm, please.?

Regards.

Pablo

Hi John

Aixit in germany used to produce ram upgrades, including one to take an STe up to 12 megs, unfortunately they stopped producing any and all atari products

in early 2000, or at least thats what they said when I emailed them in the
early fall of 2000.

With the recent postings and such regarding RGB to NTSC conversion, I'm
curious to see what the techies out there think of this device:

http://www.preromanbritain.com/gwem/martbean/ataridiy/conv.htm

It dates from 86, and requires an ST monitor cable. Has anyone
put this beast together? Would it work as presented on the site?

I am also looking to do this. I need a Ethernet adaptor though. I did some reading on getting a Ethernet-SCSI adaptor. There are some drivers that are avail too:

http://www.anodynesoftware.com/ethernet/main.htm

I was wondering if anyone else has done this and where can we get compatible adaptors?

Yes...I got my Dynalink adaptor from Roger himself at Anodyne, as he had a few in stock.
I've used it with my Falcon CT2B. It's not perfect, but yes, it does work, albeit you're limited to STing and possibly STik...unless someone has gotten around to doing mintnet drivers for the thing since I last hunted. I found this solution to be quite good and reliable for running clients. When running server software it gets a little iffy. I'm not sure if the server problems I had are specific to the Falcon with a CT2B...it just might work fine on other machines with a good SCSI host like the Link 96/97/ICD2, etc.

I also got an EtherNEC kit that plugs into the ROM/Cartridge port, and have used it successfully with both my Falcon and my MegaST. It has alot of drivers avilable for it for the various machines, OSes, and TCP/IP stacks out there. There is also a product similar to the EtherNEC, EtherNEA, but it plugs into the ASCI port instead of the ROM port.
http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm

There is also a kit someone did a while back that uses one of the parallel port adapators, lots of wires to various ports, and a hudge brick of an adapator. It's a pretty messy solution however.

Brian

> Robert he was quick to point out that it didn't come from him -

There was a lot of flaming at the time, kudos to Robert for not closing
access to the archives as a result.

Brian,

I hope you aren't talking about my attempt at creating a parallel port
adapter for the genius lan series. That was a prototype and a pathetic
one at that. The actual genius adapter by Elmar Hilgarte was a nifty
solution though seemingly a tiny bit more problematic than the IMHO
optimal ethernec solution. The ethernec worked without issue on my CT60.
That IMHO is the truest test ;-)

Well cool I will get one then if I can find one. There is one on eBay but
is missing the AC adaptor! I have a TT030, Falcon030 and 4160STe. But I
think I will just use this on my TT

My real one (in fact a totally different address). It's just one of those
things, I'll have to reapply in 30 days.

Pity, I need to trace the Falcon sound circuit to track down a missing
channel.

A bit down on my list has been networking my Falcons with my PC after I finish recasing my Falcon in a Wizztronics case and installing my CT60 on top of my Nemesis Falcon. (My other currently running Falcon is a CT2B.) If I understand things correctly, the SCSI option with drivers from Anodyne will be limited to sting, which I used successfully with dial up. It would be a bit cheaper, depending on how much I'd get a SCSIlink for. That had been my first choice, since I didn't know how accessable my rom port was going to be after recasing. Not an issue now with my Wizztronics case, since I have the rom port extender and a cartmaster lite, allowing 2 carts. Now, I have 2 dongles, Steinburg and Soundpool, but I won't mind shutting down and rebooting when I want to switch. Now I'm curious if there is any performance difference between the rom port and scsi options? I've not yet gotten into mint, so that may be a consideration later. I've used MagiC for years. Anyone got and wisdom regarding general speed between the two? (Web browsing, file transfers, ect.?)

Well after getting a deal I couldn't pass up: A TT030 system for $50. I thought about refurbishing it as the case was very well used and discolored, and missing screws. The KB also had 2 dead keys. I picked up a NEW TT030 Case top and NEW Keyboard from Best! Now my TT030 looks BRAND NEW! I have always wanted one of these babies and I would of spent hundreds of $$ on eBay for something like this, and not as good too!

Now round two. I ordered a Magnum PS/2 Memory board from Germany. It holds two 72-pin SIMMs for up to 256MB! This should be interesting. I have a 500MB HD so that should be ok for now. Also got a 2Gb External HD hooked up.

What I want to do now is load up a different OS. I am new to the modern STs, so I would like some help on getting Mint or others OS's loaded. Is there a clear step by step guide out there? I tried last night to load Freemint and I couldn't get it working. What about Linux/Unix? Whats the best option for that?

My next challenge will be getting this on my home LAN! Right now I have an Amiga 3000 and 4000 and my Windows XP box, all on broadband! Gasp ;)

Do you have the specifications for this magnum memory board? does it use
standard EDO 60ns 72pin simms or some impossible to find variant ?

I believe it uses FPM 60ns SIMMs up to 128MB in size for a total of 256MB.
I think the brand is Magnum or AixTT.  They both made a TT RAM board that
accepted two 72-pin SIMMs.  Some claimed success with EDO but better be safe
and use FPM.

I have a question about a 1.44 drive upgrade. I know that I might need the AJAX controller chip, but what about a drive? Will any drive work? I read that Epson SMD 340 or 300 will work in the case, and possibly Chinon FZ-357. But the question is what about media change? I remember the issue with STs that if you changed a disk it could corrupt the disk if you didn't refresh the dir. Is this problem still there when upgrading to HD on the TT?

Thanks
Tim

I know its kinda late, but these kind of errors, that seem to move around, can be
caused by bad ram.
Run a memory test.

Also, a flakey power supply.

Rick D.

I use the good old TOS 3.06 that came in my TT and Neodesk for the desktop itself. This machine used to run the Black Hole BBS over in Hawaii, on 24hrs a day and at the time I had the 2ga inside (still there) an ICD Host pluged into the Atari HD port on the backside with another 550meg HD pluged into it and a 14.4kb modem.

I've wondered if the programable port could be used with a 56kb modem, but not sure the BBS software would see it.

check the existing controller before you buy... the controller in my
TT was allready HD ready... so just needed to drop in a standard PC
floppy drive.

Hi I have been given a hard disk for the atari st.It was sold by Evesham Micros
it has a icd controller board built in but no power source What I need to know
is where I can get a power unit for it or help to wire one up The hard disk was
sold as a Reference 40
Thanks for any help give

Interesting...does it have a place to plug in an external brick?
Most likely you'll need a 5v (for the SCSI host) and 12v line (for the HD, some Hard Disks may need both a 5v and a 12v). Alot of more modern drives will work off 5v. In that case you'll just need a 5v line (check the HD you want to use). If this is a small case with no room for an internal power supply...simply go to Radio Shack or your favorite electronic supply store, and get yourself the appropriate external power supply(s) that you need (these are sold as replacements for typcial small appliances like portable radios). Cut the plugs off the end, and replace with whatever type you need. If it turns out you need both 12v and 5v lines, to avoid needing two AC outlets or room on a power strip for these 'bricks', get a short extension cord that will allow you to plug a brick on each side. You can even glue or tape them in place if you like.
You'll be in buissness ;)

If there is room inside the case....
Check with any place that deals in computer replacement parts. Find yourself a supply small enough to fit in the case that supplies 5v and 12v and has appropirate connectors. These are common for external Hard Drive enclosures.

Hope this helps,
Brian

Not all.  Some early TTs had TOS 2.05 and a 720K floppy.

It appears to be a standard NEC 40MB drive with an attached upgrade board for the Amiga. Look at http://www.amiga-hardware.com/reference500.html for ideas.

Well if OP has one of those, I think the cheapest solution is to buy another TT from ebay for $100, which instantly solves other problems he'll have concerning TT-ram etc. :)

Are these 2.05 TTs also the ones that looked completely different (not the Mega-STe look yet)? Might be a collector's item..

Maurits.

You should be set to go then.  I suspect any old 1.44 drive that can
be set to ID 0 will work.  Note however, that I do not have a TT, so
my information may be inaccurate.  Best verify with real TT owners.

This is certainly the case with the MegaSTE, I have an old one with a PC
floppy set to ID0. I milled out the front and fitted it flush. It even had
an Atari grey face:-). Also only had a WD1772 02-02, worked fine till one of
the custom chips shat itself:-(. The Glue I think. Win some loose some.

I would like to keep the case as is no cusomizing!  I want to find out what
drive types will work in the stock case.  I know Epson drives of that era
will work.  I have this old Chinon FZ 357 drive, haven't tried it yet.

I think so too.. but as with SCSI drives, you're never 100% sure. :)

But Tim, do you need a new drive because your old one is broken or
because you thought it's a 720K drive? I suggest you put in a HD floppy
and see if it works, before you buy and solder new controllers and
drives. :)

Maurits.

Well my 720k drive works fine, I just want a 1.44 drive, as my Falcon030 has one and it is easier to transfer files on 1.44. I need to know what drive I can get that will be a direct replacement as far as face plates is concerned. I don't mind the brand, I just want to be able to install the original TT face and have it fit in the TT's case.

Tim

Please see my website on connecting to the web using ICS. This gives some
ideas of configuring the SCSI-LInk adapter.

Site is at http://probehouse.atari.org

My point is, if you have a TT with tos 3.06, there should already be a
1.44 drive in there. Are you sure there isn't?

I keep seeing postings about STEEM and how well it works to run ST software on a PC (I have: 520ST, 2x1040ST, Mega ST2, TT030, Falcon, and Winblows XP on a dual P-III@1.2Ghz) but I don't see how you run dongle protected (Steinberg, Sonus) or funky diskette protected (Dr. T's, Hybrid Arts, ...) software with it. Also, how do you supply it with the Atari ROM images? I have considered trying it, but most of what I want to use it for is MIDI sequencing and that is mostly dongle protected software.

Larry

I've searched and seen enough answers and teasers to be going crazy on this one. I have SyQuest 44/88/200, Zip 100, SyQuest 135, and Syquest 230 drives enough to put at least one on every system that I have. (I am most interested in the Zip as the SCSI on my Falcon does not seem to work and I have an IDE Zip on it.) I have TOS versions from 1.02 through 4.04 (depending on the Atari system {ST's/Mega ST, TT030, Falcon}) as well as Windows 98se and XP Professional. I need to be able to move data between the Atari's and the PC's using one or more of these removeable media drives. I realize that there are significant partition size limitations on the older versions of TOS. But I have not been able to put the proper combination of settings tegether to get any of the media to move between TOS and Windows! I am using HDDriver 8.11 on the TOS systems (I've bought 4 copies!) and am using ICD AdSCSI, ICD Link, and Atari SCSI interfaces on the Atari's (again, depending on the system). All of the Windows systems have some form of Adaptec controller (some are embedded on the motherboard, some are on PCI or ISA cards). Please Help!!! What is the magic combination to get this to work? Where should I partition and format the media? What settings make things happy (I have tried partitioning with HDDriver and the TOS/Windows compatability mode set). Thanks for reading/responding/helping!!
Frustrated (Larry)

Oh, well I know that the #7 DIP switch is on and I have the option to format
HD in OS, but it fails, and I cannot read HD disks. So it must be a 720k.
I can read / format 720k disks fine...

Open the flap and look for the HD detect switch on the right hand side.

As new Atari HD floppies in stock.

You should be okay with any TOS, as even TOS 1.00 can support partitions up to 256meg (BGM type usually). So...here's the routine.

Pick any Atari that you can get a ZIP drive properly connected with. Alot of those older ASCI/SCSI hosts you've mentioned aren't going to be happy with a ZIP drive unless you can get 5v on pin 25 (known as Termination Power). The easiest way to get this 5v online is to put some SCSI device on the bus that can be jumpered to send term power to bus. Another way to get it there, if not already, is to grab 5v from an alternate source and run it through a diode to pin 25 on the ribbon cable.

Also...I've heard that some SCSI Zip disk models need a host that works with parity, and that there is no way to disable parity on such drives. If this is the case...you'll either have to replace your HOST, or build in a Parity generator to the host you have. Adding parity to alot of the older SCSI hosts for the Atari ASCI port involves a 60 cent chip, and about 16 or so solder points.

Once you've got a Zip properly connected....
Oh, the EZ Flyer should work without doubt...it's got enough jumpers and stuff to ensure it's parity is disabled and that the unit can get TERM power from itself or from the bus...etc...

Boot everything up. If HDDriver doesn't auto boot from your hard disk...then run the disk driver from a floppy. Hopefully you'll see your Zip drive register at boot time. Next run HDUTIL.PRG from your HDDriver package. Go to the Partition option in the drop down menus. Select TOS/DOS compatability mode. Configure things so you have ONE and only ONE partition for the entire removeable media. Click ok. HDDriver will partition the Disk, and you should be set to go with a disk that will work with both TOS and DOS/Windows systems.

Another alternative is to use BIGDOS, which will let your TOS systems access pure DOS partitions.

I'm not real clear on how DOS disks work with various versions of HDDriver. I know at one time you had to be running either BIGDOS or MagiC to take advantage of some HDDriver extras. I'm thinking that with Version 8 onward, you no longer need BIGDOS or MagiC for the TOS/DOS partitioned disks...check your manual is the best advice I can offer there.

I know I've used the TOS/DOS compatability mode several times and never had to install BIGDOS, but I also was using MagiC 6.01 (which also supports the VFAT long names).

Hope this helps,
Brian

I'm familiar with SCSI (I've been working with Xenix/Unix/Linux servers for years as the h/w tech, and they have all been SCSI based...). I have the Zip drive, a SyQuest 44/88/200 drive, a 2Gb DAT drive, a CD-Rom drive, and a 300Mb CDC fixed drive in a cabinet that I hook to the Atari's/PC at the moment. I am sure that I have power on pin 25 (I've checked with a VOM to be sure).

I have figured out the parity issue, and found a schematic for adding the parity generator chip you are referring to onto a Link for AdSCSI

interface. At the moment I'm using the TT030 as it seems to generate
parity and makes all the drives happy. I plan to order several of the
chips so that I have spares.

I'll go back through this again then. HDUTIL does see the Zip drive
and will partition it. But them Winblows won't see it! I've even
tried to examine the partition table using the fdisk under Linus, and
partitioning and Dos formatting a Zip under LInux, still no-go. I
will try again and be VERY careful to be sure that I get it clean this
time.

> Another alternative is to use BIGDOS, which will let your TOS systems access

I've seen several articles mention BIGDOS, but so far I have not found
much data or a source for it. Do you know where I can download it or
buy it?

> I'm not real clear on how DOS disks work with various versions of HDDriver. I

The version 8 HDDriver manual is vague on this, and the TOS/DOS
compatability option in HDUTIL indicates that the ZIP will not be TOS
compatible when set to a single partition. Maybe I sould send and
e-mail to Uwe I still can't get this running. I'm also going to
re-try using the SyQuest with a 44Mb disk as that is   certainly small
enough to make every one happy!

> I know I've used the TOS/DOS compatability mode several times and never had to

I've also seen some data on MagiC, but have had no luck finding much information about it in english. Do you know where I can get data on MagiC that is in english? Maybe it is an alternative I can use.

Thanks for the time to reply. The various comp.sys.atari groups have been great as I get back into these systems. I did not realize how much I had forgotten and how sophisticated the later Atari hardware had gotten as the price of the new hardware exceeded my ability to purchase it. Now I'm getting all the good stuff on eBay and if has been a lot of fun!

I really want to thank all of the posters to these groups for their feedback and assistance!

Larry

Hi!

I read you have the parity schematics. Can you give me an URL where I can find this parity add. I think it will go with a TTL 74ls280 chip? On my Atari 8bit system I have build a few parity generators with that TTL.

I would like to make one for my ST too.

Thanks
Marius

I am using a SyQuest 135 on my Falcon SCSI bus with no problems,
preferably on its own rather than in a chain. I have another one
via an Adaptec USB-SCSI converter on my son's PC. That way I can
swap carts to download on the PC and use on the Atari.

However: The cart must be formatted Atari/PC-compatible. HDDriver
8.11 will do this on your Falcon, but note that the drive can have
only /one/ partition of this type.

Regards, /Peter/

As I think I said before - if you want TOS/PC compatibility, you
have to use the special dual format that HDDriver offers and only
have *one* partition. I am sure that's in the manual.

> protected software.

Notator/Creator/Logic won't work AFAIK...unless someone's fairly recently found a way to do it. Even if they do...you can pretty much rule out the possibilities of things like Export, Unitor, LOG3, and so forth. The Notator dongle apparently does more than just simplecopy protection. It must alter currents, voltages, clocks, and so forth. Trying to get an 'image' of these dongles yeilds zilch....as it's not a standard ROM dongle.

I've not tried any Steinberg stuff yet...not even the dongle free version of CuBase Lite. IF one of these does work however...there is a slight chance you might can use the Parallel devices such as the SMP24 or the STMIDI3 interface...depending on how MROS chooses to access a ST printer port.

There are indeed a number of quality MIDI applications that are reported to work with STeem however. Many of them are legal to download free these days. Too much to list!...so...check out this really good site on ST MIDI.
http://tamw.atari-users.net/

As for funky disk formats...
Some of these are so funky that you can't make copies on your ST either (without tracking software, and in some cases additional hardware). In these such cases...there are a few things you can try...but more than likely You'll need some hacker help...someone with the tools and knowhow to make a disk image for you that can be loaded into the emulator.

First, try using disk image software on your ST that attempts to disreguard any concept of understanding the disk format, but instead tracks the disk and 'dubs' an identical copy. I've never tried this, so I have no clue where to point you in terms of program names and their abilities. I've only used the bog MSA utility...and I've no idea how it goes about its task. Someone else jump in here?

The main reason a Wintel floppy has problems with weird disk formats...can't even see Amiga or Apple disks...is because of the cheap floppy controller most of these machines have. As 'progress' takes hold, the floppy drives themselves also begin to reach a point where they only see one or two formats. If you're really serious about emulation...some Floppy controller cards can be found that plug into a PCI slot on your PC, that with the included software, and when matched with the proper floppy drive, can access and copy pretty much every floppy scheme ever come up with.

STeem is a small download...easy to set up and learn...so you're not out a thing by giving it a try.
http://steem.atari.org

Hope this helps:
Brian

I used to have a program for the ST that was called fastcopy I believe.
It had a huge display of green and red tracks of the disk (80 per drive).
This would copy games, etc with complete disreguard for error tracks,
copying the broken track in it's entirety so the game worked. This worked
for some sierra games I believe?

steem doesnt work with parallel access port on winXP (at least.. i havent
been able to use the parallel port)
Any hints ?

I have a floppy i used to do some word processing about 15 years ago.
Can i get this data from the floppy and through some emulator using my
PC? I can't remember what the programme I used was called but it

would have been whatever came with teh ST I guess, back in 1998.

PC tells me floppy needs to be formatted as it is...

Thanks

Hi,

> > Where would I get that chip 74HC280?
> Every good sorted electronic dealer should have this.

Its not as easy as it first seems. I tried my three main Electronics
mail order companies in the UK, none had it. They didn't even have
any sort of equivilant, 74LS280 etc.

I think these day, the more complex 74 logic series may be being
discontinued what with the growth of CPLDs and FPGAs. Small GALs are
so cheap now as well.

Well you register and if you are lucky you will actually get a
login/password and won't get infected with a Virus!!!

I have two Atari 520ST's. One is a original 520ST that had Boot ROMs in it. I had some 1.0 TOS ROMs lying around and installed them, esentially making the 520 usable! ;) The other is a 520STm and has 1.0 also. I am thinking I would like to reinstall the Boot Roms back into the original 520ST. Only for the simple fact that is would be kind of cool to restore it to it's original state and to be able to see how the original ST's worked with booting TOS from Disk. Since I am a Collector, I was wondering what you guys think. Should I do it or just leave it with TOS 1.0?

Hello,

I'm one of the usual lurkers here for the last year or two, but I've grown tired of the DOIT bashing -- even more tired than of some of the other stupid, useless activities I've seen here.

For whatever it's worth, I've registered for a DOIT password twice, and gotten a response within minutes each time. I owe my towered Falcon's success to the DOIT archive.

Robert, I couldn't have done it without you. Thanks for all of your efforts!

Warm regards,

Mendel Baker

P.S.

No, I never got any viruses form the archive, Robert, or anything related to either.

Hi all

Got a mega st1 from ebay, didn't (and don't) have an atari moniter.

I decided to make a moniter cable (using hallvards guidelines on
notator.org) to use my PC moniter. Only really wanted to fire it up
and check everything was in order.
Anyway, built the cable, switched it on (It's just the computer unit,
no hard d rive unit), any way, when switched on, the moniters power
light lights up to green to show life (as opposed to flashing or
orange when it's not connected or no signal, but I don't get any
picture, just a black screen.

Anyone know what I might have done wrong.
(I've tried it on two different moniters, including the one my TT is
currently running on, but get the same result)

Thanks.. Rob

The answer partly depends on ambition. This is an old problem, I think,
and is solved by changing the capacitor values on the output lines.

Or at least it seems like an old problem. If so, the solution is to change
C109 through C113 from 470pF to 22pF.

If not, I don't know.

Jim

Tim <tjlazer@nospam.mail.com> writes:

: I still have this problem on my 1040STf. I tried swapping all the socketted
: chips including the Video Shifter chip in the metal covered area to no
: avail. As the computer warms up from a cold boot the flickering goes away
: but not 100%. At first the screen is unreadable, as the flickering and

The LAN port is identical to and is wired to Modem 2. The only practical use of this port is for connecting old Macintosh modems (you don't need an adapter) or to avoid purchasing a switch box when you have two serial devices (of course, only one can be on at any one time).

G����hn...

Dumbhead

It�s not enough that several people show you on your last dumb lier
campange that my mail account do not send any virus

What you take comes from here:

174.2.142.194.in-addr.arpa. 21600 IN   PTR
user-roi2-174.dial.inet.fi.

Read it again: M A C I N T O S H do not send pc crap

If you are not confirm to localise on whitch way you got your fucking
email, simple ask your provider. But i think that�s to heavy ..

BUY virus protection

Hi,

> Its not as easy as it first seems. I tried my three main Electronics
> mail order companies in the UK, none had it. They didn't even have
> any sort of equivilant, 74LS280 etc.

Yes, you're right, I couldn't find it either, it's about two years ago, that I upgraded my STacy with parity. It was no problem to get one at that time. I used a 74F280 from Motorola that works fine.

Ciao

Marc-Anton

Hi Robert,

I tried to register from another e-mail address and I got my password
within an hour. The archive is great although I've to find somebody
who speeks german to translate some of them :).
Thank you for your time collecting all these information in one place.

Best regards,
Jozsi

Is the problem worse when the floppy drive is in action? If so, I'd check
the powersupply.

Start the computer with monitor off, leave it for 15 minutes, then turn on
the monitor, if it starts flickering, the problem is with the monitor.

The horizontal refresh rate on ST's in color modes is atrocious. Modern multisinc monitors can do the mono mode however.

Double check to make sure you have the pins wired correctly.

Eh? Orions? I'm sorry I lost you there.
Yeah, my real name and email address are not included in my usenet
posts, that's true. But when I filled in your registration form I
entered all the data you ask for, including my full name and valid
email address.

>> quite like to read some of them but I have given up hope.

Robert, the way you conduct your website is your business. But what I really don't understand is why you are giving abuse here to people who obviously are interested in your docs, and have tried to get them in a bona fide way.

Why are your replies laced with 'fuck' and 'crap'? Why are you calling people dumb? This thread started because someone had a valid question, he could not get the password. Apparently he is not the only person with that problem, judging from some of the replies.

You could have just responded by saying that ppl need to register properly without getting so agressive about it, you know. The only poster in this thread who has been impolite so far is you.

Eagerly awaiting your next flame,
JM

Errrr... Bashing? That's a bit harsh, I read some posts from people
who say that for reasons unknown to them they can't get the password,
one post with some remarks that have smileys next to them, and one
that says you will get a password and probably not a virus... ;-)

The only bashing I see is in Robert's replies... Check the thread and
see who is the more abusive poster here.

For what it's worth, Digikey does have the 74HC280 in stock, in both
DIP and SOIC. I've been very satisfied with their service -- their web
site is excellent, and the shipping is basically overnight, even
though they're in the US and I'm in Canada. They've recently opened a
UK section of their web site, with prices in pounds, although I notice
the minimum order and shipping and handling charges are significantly
higher than for North American orders.

Here http://www.atari-roms.fsnet.co.uk/ they have the english TOS
rom's for atari falcon v4.04

I have a falcon that has german Tos, therefore all language is in
german, I want to change it so that everything appears in english. Is
there any way I can do this by using the a disk version TOS. I don't
mind having to use a boot disk.

Thanks.. Rob

I'l try that. But I also have other ST monitors and it does that with all
of 'em. Must be the MB. Hate to trash the thing.

Your english is really good btw :P

Now now, there is no need to show your German A$$ on the net now is there!?

I was not infected as I have up to date AV. ;)

And all I can say is I registered and 30 days went by and no emails, then I get one with a virus. If it didn't come from you, then it came from someone in direct response to registering for a keyfile that I never got! Thats just the facts, like 'em or hate 'em thats how it is.

You really should improve the registration system too. It doesn't work. I am not the only one that has experienced this.

Tim

Hallo !

R>I have a falcon that has german Tos, therefore all language is in
R>german, I want to change it so that everything appears in english.

There's no "german" TOS 4.04. It's multi-lingual and can be set to english, german, french, italian or spanish. This setting is stored in the NV-RAM.

Well, and that's just the internal desktop anyway. Any other output will come from some program, which will either have no foreign language support at all, provide some way to switch between languages, or rely on the setting in NV-RAM in order to decide which language to use.

mit freundlichem Gru� aus Ahornberg
 Ekkehard

Hi,

well, now it's getting all personal and the arguments switch to dumbhead vs. 'german a**', which won't help resolve the problem that people have difficulties accessing a great Atari resource.

I too had problems registering, experiencing the same things other people had described here. I tried to register several times but got no answer (always waiting about 3-4 weeks before I would send another submission, as I first assumed that Robert might handle registrations manually and was just busy or on vacation).

Then I actually recieved a mail referring to the DOIT-Archives and that it has a keyfile attached. It had some xls.scr ending, which I thought could be an Excel document with the keys (I email with my Atari, so no experience with this kind of email viruses), though I couldn't open it on a Mac and on PC it turned out to be a virus. The mail came from an rwth-aachen.de (German University) address, which bounced when I tried mailing back in the thought it was probably Robert's work address. I deleted the mail, so I can't post details here for further investigation. Probably it was just a strange but unconnected circumstance.

Then some time later I was able to catch Robert on irc and he explained to me, that registrations are automatically processed and that he wouldn't send mails with Excel attachments. He also pointed out that the form had to be filled out correctly to avoid rejection. I was sure I always filled out the form correctly with real name, real email-address etc. Anyway, I decided to give it another try, filled out and submited the form and got a mail with the keys within the next day.

These are my experiences and probably there is a bug in the automated registration process, probably there are 50 Mac users trying to register and 30-40 get through, or probably there is something wrong with Atari users.

Regards,
Jan Daldrup

Now I need the original Software, know where I can download it?

Also what programs work on the TT. Do ST programs run?

I also need to know if I can hook up a SC1224 or SC1235 to it. It came with a 19" Mono monitor.

Thanks
Tim

Hi Rob, all Falcons have the same version of tos. You need to set the nvram
to English, you can also specify the keyboard etc. Have a look here,
http://storage.atari-source.com/atari/mirrors/ftp.lip6.fr/pub/atari/Falcon/
Utilities/
and download nvram.zip. Do be careful because an incorrect setting can
bugger things up.

Mark

The "Normal" ST monitors don't work on it, mine has an old IBM color monitor on it. I didn't get to see that guys replay, otherwise I might have been able to talk one of my Dahlia Growers up there to get it for me and ship it down. It would have replaced my dead falcon.

I run some ST programs on mine, mostly WP's and such, have never tried a game. I also run the graphic editors too. I don't have any cards or such in mine, it's a stock 4X4 with a 2giabyte scsi drive in it.

--
"In this universe the night was falling,the shadows were lengthening
towards an east that would not know another dawn.
But elsewhere the stars were still young and the light of morning
lingered: and along the path he once had followed, man would one day go
again."

Hello,

Check out the MyAtari online magazine site. In the October issue there is an article I wrote called Broadband ST. I talk about using the cartridge port of the ST to get access to the EtherNet. This would also apply to the Falcon and the TT. I am using the EtherNEC hardware device...

well there's not much you need other than maybe hard disk drivers.

All GEM/TOS based apps should work fine, games are more of a problem... they will have more of an issue with the clock speed, CPU differences, TOS version or the lack of a blitter chip. But some will work...

Standard PC monitors can be used if you want some colour

sounds like you picked up a bargain there, the TT is getting quite rare now... i've had mine for about 9 years though has been upgraded with a Crazy Dots II video card, and 28mb of TTRAM

You know I did not start this, I did as you did and explained what happened and I got attacked by the german. This was a few months ago. He told me it was not from him or from registering on the site. And it was clearly from registering from the site as it happened to you and countless others. I simply wanted know if others had the same problem, and Robert comes out with his gun shooting. What he needs to do is rework his registration process and stop bad mouthing people.

/rant off

umm it could just be dry joints on the monitor socket, or the associated video circutry.

pull out the board and resolder the whole monitor socket.

Atari was well known for crappy soldering.

I remember having my joystick ports resoldered about 3 times with my
520stfm. Originally we bought a 1040Stfm and it was completely dead out of
the box. they were sold out at the time and we settled for the 520 and were
refunded the difference.

Ahh yes, the memories of unpacking my brand new ST, still got it too!

I got a TT030 and the power LED was disconnected. I read that the power
pins were back right of MB so I hooked it up to the pins, the LED burned
out. I would like to know exactly were the LED goes and what pins. I plan
to go to Rat Shack to get a new LED. What power does the LED need?

Thanks
Tim

something is wrong, LED's last a very long time.

Measure the voltage at the connector and make sure its not something silly
like 12v comming out of it.

There are 3 pins at J102. I plugged the LED into the last two pins and it
did nothing, so I plugged it into the bottom 2 and the LED flashed and went
out. This is the stock LED. I will get a volt meter and test the pins.
What should they be?

Tim

I can see that Robert wants to keep track on who's got copies of his work,
but I have to say that I too have been unable to get a key.

The last but one time the supplied key didn't match the archive's. I was
told that only contributors to doitf030 would henceforth have a key for the
latest version, but there was no opportunity to download an earlier version.
It's no joke for dialup users as it's a large archive.

My last attempt (on Friday) was met with a resounding silence.

My apologies to you Robert.

I've just received an auto email from your system with the same information when I tried again this morning.

The email with the archive key never arrived, so if there's any chance of a repeat please?

A small point, the input field for the Zip code is too short for UK-format, my post code is 9 characters long :-)

Hi Rob!

I am not 100% sure, but I think *all* Falcons had universal TOSs which could be selected from the NVRAM, using NVCONFIG.CPX. This is a 4-part CPX, though this isn't immediately clear. Just click on the right-facing arrow at bottom right to bring up the Keyboard panel. It offers 17 - count them, 17! - keyboard layouts (besides the main European ones also Turkish and Saudi!!!) and 5 languages, which should be enough for almost anyone!

Regards, /Peter/

Ok I will try that.  Wish there was a RF port to test on TV to see if it is
indeed the video or the socket.

Yeah well I had a 4MB 1040STe that was really yellow.  I bought a new
1040STe case and 4160STe label from myatari and installed my guts into it!
Now I have a *brand new* 4160STe!!! ;)

Got the LED working: It goes to J103 next to the speaker pins.

I never received that unfortunately, nor the repeat transmission that I asked for earlier in this thread :-(

Could you bear to send another key to:

derryck@cix.co.uk just in case ntl's mail server is up the creek please?

> I had nothing to do with transport and receive of

Sure, but LP meant the too-short post code (zip code) input field on your web page :-)

I have always got keys from Robert by return and find his service very good. But I too had received the fake virus mailing masquerading as a key (many months ago now) and when I contacted Robert he was quick to point out that it didn't come from him - and it wasn't from his address. What I wasn't able to establish was whether only people who had applied for keys were sent the fake key mail - in which case it would seem that someone had hacked into Robert's database, or intercepted mails to him, or had managed to get him to send the info out somehow - or whether it was a more general virus attack which included key applicants and they were the ones who complained in this Usenet group since non-Atari-using recipients would probably not read it.

I am quite sure that Robert is quite blameless, and as he uses a Mac is less likely to be affected by the usual viruses using address books for replication. But there are ways of hacking into Macs too, I am told, and if a mail delivery address is somehow intercepted, it doesn't matter what machine is at the other end.

Regards, /Peter/

>How do you do this? i have a 4mb ste and I'd like to have a try

You need a TOS image file, usually named TOS.IMG (a 256KB binary dump of the 2.06 ROM), and a loader program. You put the loader as the first program in the AUTO folder on the boot drive, and TOS.IMG wherever the loader expects to find it (usually in the root of the boot drive). When you start the computer, the loader puts TOS.IMG into appropriate memory location, the computer then reboots by itself, and then you have TOS 2.06.

There used to be several loaders around on the ftp sites. I was satisfied with the one that came with the "tospatch" utility made by Markus Fritze and Markus Heiden some years ago. It used to be around in a package named TP206V38.LZH (e.g. at Berlin technical university ftp site, etc.), though I remember that a newer version was available somewhere at author's site.

This loader and patch utility work with German TOS 2.06 (though a version for the English one also exist(ed?) on the net, look for an archive named TOSPATUK.LZH or something like that). You process TOS.IMG through the patch utility which adjusts it for loading on the memory loacation suitable for the amount of RAM on any particular machine. You can also use the oportunity to make other small fixes in the TOS image, as the patch utility comes with a command file containing a number of pre-defined useful patches which can be selected or deselected. Among the more useful ones is a patch to make the RAM-loaded TOS 2.06 reset-proof, so that you don't need to reload it after each reset, and a possibility to edit the embedded resource files to translate or to alter the look of dialogs, etc.

Btw. if TOS 2.06 is to be used without a hard disk, it is possible, with some equilibristics, to create a small auto-loading, reset-proof RAM-disk to hold e.g. the desktop configuration file, the desktop icons file and the AUTO folder; after the first time the computer can then reboot from that RAM-disk, so that one need not insert a boot floppy every time (that is, unless something catastrophically corrupts the memory).

I seriously suggest that you fix the power supply before further using that computer. That voltage is way out of tolerance and can cause damage to existing or any future components of the computer. It should be relatively simple to replace the trimmer, shouldn't it?

Btw. does 5V have a separate trimmer in a STacy? Is that votage OK?

Yep, hardwarebook.net has most Atari stuff. Strangely enough in the "Mouse" section the Atari mouse is missing. There is an Amiga mouse but that's different isn't it? Anyway I think all other Atari connectors are there, even the exotic Jaguar ports and the ST cartridge port etc.

Hardwarebook.net rules :)

I have 2 spare ICD SCSI internal adapters sitting in my Atari spares if
anyone is Interested. One is boxed (basically brand new). If you're
interested then make me an offer, I live in New Zealand but the freight
wouldn't be too much.

Regards

Hello,

I would like to check if the docs I have about MVDI support (special
XBIOS functions for Milan VDI) are right. To this end, I need the drivers
themselves. These ones, when installed, add a cookie _VDI. If you have a
Milan, and these drivers, could you send it to me ? Thanks.

Uh!
that's a lot of wires!

My case is different from yours (i guess yours dont have built-in psu)
Well.. i'm curious, so i'll try it..

Hope to find that hd somewhere

Thanks :o)

>guy hasn't 2 left hands (or right, if he's left-handed ;-)

I doubt that it is possible, perhaps you do not remember well. Older TOS
versions were located at $FC0000 and there is only 192 K hole in the
address map there, so 256 kB of TOS 2.06 can not be fitted there or they
will be in a colision with IO address space. Default location for TOS 2.06
is $E00000 and one needs, if not a small board, then at least a couple
of free-floating TTL chips (perhaps glued upside-down to the mainboard)
to do the necessary decoding.

>Will search for the schematics asap

Please do.  I am interested to see if there is perhaps some trick involved
which I am not aware of.

Ho ho ho, no, make that Oh dear....still wasting time trying to re-invent the wheel, I see.

As you say, this has been done to death, all you've done is add un-necessary detail and complication.

If you must continue to interfere in the Atari world, UPDATE the Notator pages.

Grrrrr.

Votex plus 20 ... I assume that's a whopping 20 MB right? Hehe... :-)

The ADAPII, is that a custom build of yours or was it really manufactured by Hybrid Arts?
I've never seen nor heard about such a machine.

By the way, I own a Falcon mkII manufactured by C-lab.

Kind regards
Mikael Hillborg

Hi All,

I've an old 1040 STf and I would like to perform a TOS upgrade.
(possibly to 2.06)
Can anyone help me? I can only find dead links on the internet. I'm
interested in any solution.

Thanks and regards,

Jozsi

Yup, buy an STE, it's cheaper all round, memory and TOS.

Use the STF for spares.

Or a MegaSTe. Yes, that might possibly be an optimum sollution.
On the other hand, Joe might be interesting in hardware-hacking
it just for fun, in which case he would need a pair of EPROMs for
TOS 2.06 and a couple of 74HCT*** chips. If he is still interested,
instructions are available.

One can also load TOS 2.06 into RAM, at least for a test, though
it leaves very little free memory on a 1MB machine.

I've a STacy 4 sitting here.
It has a new screen in it...supposedly.
The hard drive died, but I kept right on using it for some time.

One day, as I was using it the image faded away into a perfect grid like pattern (like windshield defogger lines). These lines (the whole screen) fade to blue when rebooting, and of course go to black upon powerdown. In other words, the screen is nice and bright...grey and blue, and this patten is displayed tack sharp. I just no longer see my desk top.

I really don't think the screen itself is bad.
Maybe it's the video board inside. Not much to it other than a few rows of capasitors and a few adjustable trimmers. I have no clue how to test for bad circuts tho' :/

When I hook up my Atari Monochome monitor, the machine functions as it should.

Any idea what might be wrong?
I called a few places that still fix the things, and they claim they won't even look at it for less than $600, and go on and on with some foobar about how it has be totally rebuilt to original specs.

Also, is there any good reason why I can't put an internal SCSI ZIP drive in the STacy? I know it's not quite as tall as the early 3.5" drives that were put in a STacy, but I don't mind a little gap over or under the drive...so long as it works.

Brian

CuBase runs pretty well under Geneva.
In fact, on a Falcon...to do application switching around Steinberg applications, it's the only choice I know of...even Steinberg's own task switcher refuses to tie in with a Falcon.

If you've an ST or STe...try Geneva without a desk top, or use Stienberg's own little MROS task switcher...that is, if you can afford to partition off your memory like that.

MROS and Geneva get along well, and Geneva won't hog up memory...nor does it try to partition off your memory into multiple 'virtual machines' like the MROS switcher does (accessaries and things like that get loaded more than once).

N.AES/Mint or MagiC is quite nice if you do any networking.
While STing does work under Geneva...the machine seems to run alot smoother with stacks like this when using a preemptive multitasking kernel.

Other than running CuBase or Notator...I highly recommend a well tuned Mint or MagiC setup if you've 4 or more Meg in your machine. For machines less than 2meg...it gets kind of iffy wether a preemtive kernel is worth the bother...as the advantages it offers start to eat up memory fast, and you've not much room left for running applications.

Just my two cents.

Brian

Have you checked the connectors? The cables? If you've opened your Stacy a
few times one or more of the wires that goes to the screen could be
trapped and possibly damaged. I got a very similar error myself once after
reassembling my (now dead) Stacy, after a bit of wiggling about with the
wires and connectors it worked fine.

No problem, as long as you can set the SCSI ID of the Zip drive to zero,
don't terminate it and ofcourse remove the old drive.

Hi,

It would be great, if you could help me with instructions. I've just
bought this computer and I don't want to buy an STE for twice of its
price (shipping costs almost the same).
I also tried to load TOS into RAM, but really not too much memory
remained.
So if anyone could help me ....

Best regards,
Jozsi

That is what I did and have never regretted it. The STe does have
TOS 1.6, but that is ok. Works great...

Instructions can be found e.g. in: <http://hardware.atari.org/files/tos206.zip>

Please note that these do -not- explain how to burn EPROMs, but assume that you have a pair of EPROMs ready and tell you how to hack the 1040ST in order to make them work.

Note that for a TOS 2.06 upgrade you need a pair of 128KB EPROMs (e.g.27C010), three 74*** chips and some hardware hacking as these EPROMs do not fit into the sockets on the motherboard.

For an upgrade to TOS 1.4 you need six drop-in 32KB EPROMs (27C256) and maybe reconnection of three jumpers on the motherboard. If your 1040ST motherboard does not have six sockets for ROMs but only two, you may have to solder the sockets into (existing) locations on the board.

So, upgrade to TOS 1.4 is much easier. On the other hand, TOS 2.06 is -much- better.

EPROMs (27C256 very common and 27C010/1001 somewhat more rare) can be extracted for free from old PC boards- if you have the resources to reprogram them (TOS images can be found on the 'net). Chips if 150ns speed or faster would be fine.

And, if you are into programming the EPROMs, you may also look on atari ftp sites for "tospatch" utility to fix some (non-critical) bugs in TOS image before burning it into EPROMs.

> trapped and possibly damaged. I got a very similar error myself once after
> reassembling my (now dead) Stacy, after a bit of wiggling about with the
> wires and connectors it worked fine.

I pulled the entire harness, tested every wire with a meter and I get a positive beep on every connection...I shook the mess out of it...whipped a couple students with it, and tested it again. Apparently the problem isn't in the wires. I must admit I was HOPING it was a broken wire, as that is an easy fix.

Someone in the thread mentioned having a dead STacy laying around. Any chance I can talk you out of that little power suppy board that has a pair of trimmers for 5V and 12V adjustments? It sits right next to the SCSI host. I 'suspect' my problem could be somewhere in that board? If that's not it, then I'm just praying some microsopic unreproduceable gals or something haven't been fried somehow :/

Again, the screen itself is new.

The STacy works fine through an external monitor. The LCD powers up displaying a perfect bar line pattern that resembles those heater lines they used to put in car rear windows to defog/deIce them..

Any further tips on this would be greatly appreciated!

Thanks,
Brian

hi,
i have an Atari MegaFile 60 (60mb) and a Vortex HDplus 20 (20mb..wow!!!)
external hard drive units.
i remember reading somewhere that there is a way of upgrading the hard
drive in these units..

is it possible to replace the original drive in the unit with a standard
scsi hard drive?
or is it a bit more complex than that?

i thought i read that the mega file was just a ASCI fo SCSI converter...
i may be wrong...can anyone help??
cheers

I'm not famaliar with the Vortex, but I'd wager that you've a better chance of upgrading that than you will the Megafile. It is most likely a SCSI I host adaptor with normal 50pin SCSI I connectors.

As for the Megafile....
Those use an rll disk mech, not a SCSI one. These units are kind of hard to find, very large, heavy, slow, noisy, and rather expensive per megabyte should you happen to find one still in stock, or refurbished somewhere. I just paid $45.00 for a used ST-277R 65meg (more like 60 or less once formatted) to get my Megafile 60 working again.

It should be possible to put larger rll drives in the Megafile. If there are any limits to the size of the drive the ASCI/RLL host can address, I'm not aware of them. One thing I have learned...is when you start getting into RLL drives over 60meg, you tend to get into FULL HEIGHT (twice as tall) units that are too tall to fit in a Megafile case.

> is it possible to replace the original drive in the unit with a standard
> scsi hard drive?

In the case of the Vortex....if it's a SCSI host....yep, should be. Consider these things....
If it is indeed a SCSI host, it's likely an old SCSI I host. What ever hard drive mech you try on it, make sure it can have parity disabled in case that old host doesn't support parity. If you do end up with a drive that needs parity and you really really wanna use it, and if the host doesn't support it...one can build a parity generator with a single ship and a bit soldering.

In some cases, you might find a SCSI device that can not provide its own termination power and must have it supplied on the SCSI chain (either from the host itself, or from another device). Some hosts provide this, and some do not. If yours doesn't, and you need it...there are a couple of solutions. One is to connect one SCSI device that can provide term power to the whole chain (many can do this with a simple jumper setting). The other is to tap 5V from somewhere else to the SCSI chain with a bit of wire.

> or is it a bit more complex than that?

It shouldn't be much more complex than that....
Another thing to keep in mind....
If you get into really large hard drives, there are definately limits to partition size, and how many partitions can be seen by TOS/GEM at a time. Up to date hard disk driver software, if not a MUST, will certianly help in many ways. I recommend HDDriver 7 or higher, as it is well prepared to deal with matters such as large drives, changeable media (like a ZIP disk), PC compatable partitions, and more.

> i thought i read that the mega file was just a ASCI fo SCSI converter...

I think this is partially correct, tho' I'm not sure. ASCI-SCSI-RLL....
The connectors inside however, are RLL/MFM. I do not know much about it other than that. I decided to play it safe when my drive started loosing sectors and replace the mech with an identical model number (Seageate ST-277R).

> Question is, can I play around and hook my SCSI drive into the Supra Hard
> Drive? Can anyone suggest any way of doing it?

Should be able to do this without much fuss.
I don't know all the specs on the Supra host but some common SCSI issues with SCSI I hosts that old are as follows:

1. Many older hosts for Atari do not provide termination power. Some devices need this.
2. Termination is important. Terminate the LAST device on the SCSI chain only.
3. Some older hosts do not support parity. Some SCSI devices must have this.
4. Driver Software will be needed for your SCSI device.

Those are the two most common problems people run into when trying to connect things SCSI to an Atari. The good news is there are solutions to both.

1. Most SCSI devices have jumper settings that offer an array of termination power settings. The rule is that the SCSI bus should have 5v on pin 26 (I'm pretty sure it's 26 but check to be sure) either from the host itself, or any single device on the SCSI chain. Most SCSI devices can be set to supply their own term power when it's not present on the SCSI chain; however, some can not. If you end up with a device that needs this 5v, then you need to have some device on the chain set to supply it, OR, use a wire lead to tap 5v from an external power supply. You can probably find a 5v lead somewhere in the Surpa shoe box power supply if you need this. There is also a 5v pin in the joystick port of the Atari that you can tap from.

2. SCSI devices usually have jumper settings or termination packs (little comb looking circuts that will be very near where the 50pin cable connects to the device). You will only want the LAST device in the chain terminated. Any device(s) in the middle of the chain...remove the termination pack(s) or change the jumper. If you use several external devices each in their own case, and like to swap and exchange things SCSI frequently, then I suggest getting an external termination block, and just unterminating the entire lot of SCSI devices. This way it's easy to remove or add boxes...just pop the termination block on the last device in the chain ;) Lots of things sold as external SCSI, may have a termination switch outside the case...again, if it's the last thing in the chain...turn it on....if it's in the middle of the chain, turn it off. Only the first and last device in the chain should be terminated...the host itself usually being the first thing terminated.

3. Several SCSI hosts were made for the Atari ASCI port that do not support parity. If yours is one of these you might run into problems. Most SCSI devices have a jumper to disable parity; however, some do not. If you want to use a device that MUST have parity, and your host can't do that, then you can build a parity generator into your SCSI cable using a single chip and a bit of soldering.
http://atari.nvg.org/parity/parity_gen.html

4. Whatever SCSI device you plug in, you'll need driver software for it. The hard disk drivers that come with the Supra tend to be fine for hard disks up to around 500meg, however; you might run into some oddball drives that need SCSI arbitration and can not be 'booted' from an ST, but can be used otherwise. For a slew of reasons both technical, and practical, I highly suggest using HD Driver 7 or higher for hard disks. With some Ataris and hosts, HD Driver adds SCSI arbitration. It definately adds support for larger drives (1 gig and higher), more flexable partitioning of your hard drives, is very fast, and up to date with alot of newer standards likely not present in the stock Supra drivers. For CD-ROM devices, I highly recommend ExtenDOS. ExtenDOS comes in variants for CD reading only, or in various suites that can support CD writers. ExtenDOS also comes with tools for playing Audio CDs via the CD-ROM device's analogue leads (if present...most have it), and for ripping audio tracks to your hard disk into WAV or AIF formats. There are also drivers out there for SCSI Scanners (Such as the Mustek, HP, and some others as well). You can also find drivers for Dynalink SCSI ethernet boxes, tho' I don't know if they'll work with the Supra host or not.

> Also, and not really relevant, does anyone have a spare ST joystick they can
> sell me? I can't play Llamatron without it and I so LOVE that bloody
> annoying game!

Sorry, no spare here, but these are not hard to find. Try ebay or any of the usual Atari suppliers. I think Amiga joysticks also work straight away with the ST.

Brian

It'll be the IC that drives the LCD, replace it and it'll work. Finding one,
well, that's a different story. perhaps you can do a deal with the owner of
the dead one.

A Megafile 44 is indeed just an Atari case with an ACSI to SCSI converter and a Syquest SCSI drive inside. A Megafile 20 however has an MFM/RLL drive. I don't know about the Megafile 60.

Still, even in the Megafile 44 the interface is pretty limited so with more "modern" SCSI drives you could have problems, even if it's SCSI-1.

The funny thing about the Megafile 44 is that it has enough room for a second harddisk. So a popular modification was to add a SCSI drive to it, I have one of those at home. Quite handy to have a box with a 44MB removable drive and a 105MB fixed drive inside. :)

Maurits.

Hello Atarians!

I have a STacy 4 and a SCSI Zip Drive I'd like to put in it since the measely 20meg thing that came it fried some time ago. Another good reason I'd like to go with the Zip drive is because it runs off the 5v floppy line. The 12v trimmer on the STacy power supply that drives an internal hard drive is so flaky that only 2 voltages stick...fully closed (4.5v) and wide ass open (14.5v) *I suspect that's why the old HD fried!*

Anway....
When I put the Zip drive in there, it can't see it. My guess is that the Zip drive needs parity and it can't be disabled *at least not in an obvious way via switch or jumper*. Anyone know if there might be a way to disable parity on an IOmega Zip100 drive?

I'm looking at a DIY url I chanced to find, but it's all greek to me.
http://atari.nvg.org/parity/parity_gen.html

Is this something you just build into the SCSI ribbon cable or what?
Where would I get that chip 74HC280?

Anyone in the USA that would build this thing for me?
How much would you want to do it?

Thanks,
Brian

Hi All,

Do you know this site : http://www.doitarchive.de/homepage.htm ?

Can anybody tell me how to obtain password for the zip files in the download area? I tried to fill in the registartion form/direct emailing to them but there was no response.
There are useful technical documentations in them.
Help me please...

Jozsi

Hi,

> Is this something you just build into the SCSI ribbon cable or what?

No, you have to open your STacy and put it piggypack on one of the chips of the "SCSI controller". You will find more information on how to do his in Chips'n Chips Hypertext from Michael Ruge or DoitST from Robert Schaffner. I don't have the URL's so just google a little bit.

> Where would I get that chip 74HC280?

Every good sorted electronic dealer should have this.

Ciao

Marc-Anton

Hi All

I am hoping to get true ethernet networking on my Falcon and my TT. I am having a hard time finding a 'step by step' guide to implementing this using the built-in TOS, and harder time finding out how with alternate OS's that I can't seem to get much data on (MultiTOS, MiNT, MagiC).

I did find a couple of VERY simple ethernet interfaces that seem ideal to the task (they are so simple that the Atari 8-bit forums are using them with the 8-bit cartride port!) The links are:
http://www.embeddedether.net (about $50.00US)
http://www.embeddedethernet.com (about $70.00US)

Is there anyone in the 16/32 bit community that is familiar with these and/or has implemented them?

Is there any site that has a 'step by step' guide to getting an ethernet connection up? How about for file and printer sharing (Windows SMB, NFS, LPR) and/or internet access for downloads (ftp, ssh)?

Has anyone used the 'LAN' port on the Falcon or TT to get netowking up with Linux (or other OS)?

Is there a more appropriate forum for these questions?

I have spent quite some time searching the internet, have I missed some usefull sites (probably...)?

I really want to get my Atari's talking to my Linux and Winblows systems, I have a Linux RAID 5 server with DAT backup and that is where I want to store most of my working files and software backups.

Larry

The best solution atm. seems to be EtherneC device, see:
http://hardware.atari.org. It contains drivers for STiNG, MiNTNet and MagiCNet

> Is there any site that has a 'step by step' guide to getting an

> ethernet connection up? How about for file and printer sharing

> ssh)?

For MintNet setup is similar to Linux (Unix in general) setup. For MagiCNet
it is Unix-like too IIRC, for STiNG it is diffrent (there are guides in the
STiNG package)

NFS and SMB filesharing is possible under MiNTNet, I do not know about
pritersharing, but should be possible too. Internet acces is not a problem
(all standard apps are ported, and there are native ones).

> Has anyone used the 'LAN' port on the Falcon or TT to get netowking up

I do not know about such solution.

> Is there a more appropriate forum for these questions?

I do not think so.

> I have spent quite some time searching the internet, have I missed
> some usefull sites (probably...)?

http://www.google.com
http://www.atari.org

FreeMiNT (MiNT, MultiTOS, MiNTNet): http://sparemint.atari.org,
http://www.freemint.de

I'm not familiar with the interfaces to which you link, but there is a project that provides Ethernet via the ST/TT's cartridge port or the ACSI port:

http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm
http://hardware.atari.org/ether/index.htm

> Is there any site that has a 'step by step' guide to getting an ethernet connection up? How about for file and printer sharing (Windows SMB, NFS, LPR) and/or internet access for downloads (ftp, ssh)?

There's lots of software for doing many of these things, but I've not yet dug into them much, so I can't provide specific pointers.

> Has anyone used the 'LAN' port on the Falcon or TT to get netowking up with Linux (or other OS)?

AFAIK, those ports are useless as anything but high-speed serial ports; to the best of my knowledge, nobody's written any software to let them function as network ports.

> MagiC).

MintNet is going to be your most flexable as far as the networking goes.
I also understand there is a version of MagiCNet that is very close to
MintNet...in that it can use alot of drivers and such.

For MintNet...you get the standard Unix things.
NFS for mounting hard drive partitions (across other machines that support NFS)
http servers like apache.
telent servers
ftp servers
etc....

Clientwise for MintNet....you get the unix standards like lynx, pine, etc...
Some Xwin 11 clients can also run under MintNet.
With a socket called GlueStik you can also run most, if not all of the STik/STing clients/servers with MintNet.

STing is also quite good, tho' you'll have to rely on ftp for cross platform file sharing. Between the two Atari Boxes however, there is a drive sharing utility for STing where one can mount each machine's drive partitions to the other's desk top. I forget what it's called (BNet I think?), but I do know it's out there.

On the server end for STing....
There is a basic http server.
A Basic FTP server.
And a utility for mounting TOS/GEM hard drive partitions across the LAN.
AFAIK there isn't any standard file sharing protocol for STing such as NFS.

I do belive that with the STing archive, there is information on how to network TOS/GEM machines using MIDI, Serial, LAN, and even the Printer ports. A TCP/IP link between the machines in essence. As for clients that work via the TCP/IP ring...there is the BNet thing I was talking about, and your usual STing clients and servers like ftp and http.

Unless you go with an ethernet solution, the easiest way to connect two Ataris, is using the MIDI ports. The fastest way is to build a special printer cable that connects the two via parallel ports. One can also use a null modem cable. It may even be possible to turn the so called apple talk (lan port) into a null modem type connection?

Brian

You have look. Read what the site says.

Do not press "send" butten serveral times.
All this kiddy crap are bounced and delete automatically

So, banning an entire domain as a means to filter spam.. filtering out forms when send is pressed more than once (without letting through even one of the transmissions).. I bet you have a lot of customers, don't you? :)

```

That's likely.. I think I read a few dozen posts in this newsgroup
already of people trying to register for the DOIT-archives.. people
already think you abandoned the project or that you're dead. :)

Maurits.

Same here, I filled in the thingy for online registration and never
heard anything.

And yes Robert, I only clicked once and I did indicate what I was
looking for.

Shame, it seems to be a good compilation of technical docs, I would
quite like to read some of them but I have given up hope.

I still have this problem on my 1040STf. I tried swapping all the socketted chips including the Video Shifter chip in the metal covered area to no avail. As the computer warms up from a cold boot the flickering goes away but not 100%. At first the screen is unreadable, as the flickering and rolling happens. Then it slows and the screen comes up but is flakey. Looks like someone is wiggling the video cable. Wish the unit had a RF port to test it on a TV.

Any ideas?
Tim

I got my STe working on my 17inch Comppaq monitor using a vido
convertor and an old piece of Atari hardware called "Video Key".
Worked pretty good, but the look could be improved on.

>While it is true that most PC monitors don't have speakers some of the new TFT flat screen monitors do come with speakers so perhaps you should include instructions for both, essentialy it will be the same except that you would use a 3.5mm jack plug as opposed to a socket for external speakers.

While I agree with most of your posting, and that some TFTs have built in speakers, I wonder how suitable TFTs are for use on an Atari? Because most seem to offer only a couple of resolutions, all much higher than normal Atari ones. Even if they can be made to run at the usual Atari resolutions, I wonder whether there will be a kind of beat-effect or moire interference between the discreet screen 'pixels' (much larger than a colour CRTs) and the Atari-generated dots. Anyone tried it? Certainly on my son's TFT on his PC I had to switch on anti-aliasing to make the normal fonts readable - portions of strokes at the pixel edges were missing or so thin that they made reading really difficult. Haven't tried it on my Falcon - not sure he'd approve :-)

Regards, /Peter/

You will have seen Fred's TFT monitor at the club meeting working with his Falcon months ago - superb result, but success depends on the monitor matching the synchs/res.

You should try your son's monitor when he's not looking ;-)

I'm using a Samsung SyncMaster 152s TFT with my TT and ET4000 graphics
card.

1024*768, 800*600 and 640*480 works great after some tweaking with
VMG-4000.PRG . 1024*768 matches the pixels exact and gives a very nice
and crisp picture at 256 colours.

640*400 also works (at boot before NVDI takes over) but will not fill up
the entire screen to the right.

I have not tried it (yet) using the built in TT monitor connection or
with a ST, STe or MSTe using an adaptor.

A good thing with TFT monitors is that the do not flicker at lower
freq. so 60 Hz produce a perfect image. Perfect for a Falcon, I guess...

Hmm nope, but better not ask or they will start advertising that as well
(and it won't work). :)

I do know how to stop pop-ups in your browser without spending $30+ on
software: Get a good browser and select "disable pop-ups" in the
preferences.

Easy :)

Maurits.

hi, i have just purchased a lovely Mega 4 system, rack mounted (Hibrid
Arts,Inc) but it is running Tos 1..
i have seen on the internet Tos 2.6 for the Mega ST, can anyone tell me if i
am going to have problems?!!

software or hardware problems that is!!! PS do i need to solder anything or
do the chips just plug in?
any help
cheers in advance..
john

If it's running TOS 1.2 (dated 1987 in desktop info) you could benefit of getting TOS 1.4 (dated 1989). This upgrade does not require any soldering. I guess most Mega 4 were delivered with TOS 1.4?

TOS 2.6 Can't be used in a Mega ST without an extra add on board so you will run into problems, yes.

The simple advice (if you have TOS 1.4 now) would be to use a replacement "software" desktop like Neodesk. There are also some free desktop apps. This will give you a much more advanced desktop compared to TOS 2.6 .

The main difference TOS 1.2 => TOS 1.4 are lots of bugfixes
The main difference TOS 1.4 => TOS 2.6 is a new desktop

thanks
here is a bit more info for you...
i am running tos 1.02
with a tos size of 192k

the computer came with a floppy 'NeoDesk 2.0'

it's ok, but i can't find a way of getting rid of that horide brick desktop background

john

TOS 1.2 = TOS 1.02

Can be upgraded to 1.4 just by putting in the new IC's. Might be a set of
six or two chips. I'm not shure but I think you have to open or close a
"solder joint" if number of IC's differ?

>the computer came with a floppy 'NeoDesk 2.0'

Check out http://www4.pair.com/gribnif/updates.htm where there are free
```

updates all the way up to Neodesk 4!

When upgrading operate on a copy and not the original disk if anything
should go wrong.

>it's ok, but i can't find a way of getting rid of that horide brick desktop
>background

Don't know about Neodesk 2 but in version 3 you first select "Edit
Icons..." from the "Options" menu in Neodesk.

This opens the Icon Editor with another options menu. Here select "Edit
Desktop Pattern".

thanks again,

i will have to look out for the tos chips, because my other atari's are : 3 x STe running tos 1.62
and a mega 2 running 1.02

i have checked out the link to neodesk and will try them out tonight...

john

I use a Link 2 with ICD Pro Utilities on my Mega ST4. Upgrading to a Link
97 isnt an option. Neither is switching from ICD's software. What I want
```

to know: Is it true the capacity I can't exceed is 1.2 Gig. I want to use
a SeaGate ST-11200N. Please E-Mail me.

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

```

With HDDRIVER there is no limit to the hard disk capacity with the Link 2. You can try the demo version on http://www.seimet.de/hddriver_english.html.

Correct me if I'm wrong but isn't that so that HDDriver alone isn't enough. PlainTOS can't cope with large partitions. One need FreeMiNT or MagiC aswell. Correct?

CU,
Martin

hi, is it possible to just connect a scsi hard drive directly to the main
motherboard of a mega 4?
I know I would need to power the drive externally..
just hoping it's a possibility...
cheers
john

Because I got so angry from all these SWEN virus mails comming from infected Windows users I came up with the idea tonight to boycott Outlook Express users by exploiting an old bug in that program.

It works both with Outlook Express and Outlook for mail and news and it's only a matter of putting the letters "begin " at the beginning of a line. Everything below that line will not be displayed at all when you try to read the message.

I seem to remember that Newsie also suffers from this bug and that is a pity. Perhaps it can be avoided in some way??

Anyway, another guy jumped on the idea and created http://ichimusai.org/oe/ which is a good description of why you should not use Outlook or OE.

If lots of people would do this and make the OE users complain to Microsoft, then they will hopefully fix this bug.

As a side effect more users would go to WindowsUpdate and fix there old buggy OE installations and less SWEN viruses would spread because of un patched OE versions.

Thanks, so far the viri aren't causing any damage to my system, but someone
is determined to!.

> It works both with Outlook Express and Outlook for mail and news and it's

We seem to always miss something when we get onto this subject, its the
people exploiting the software holes that need stuffing, not the poor
barstard that's getting exploited. It may be an MS product on the receiving
end but the problem is caused by the virus writers.

> As a side effect more users would go to WindowsUpdate and fix there old

The vast majority of the peops i speak to in Windows bases are patched up,
it only takes a handful to bring a chain of servers to their knees.

for some time now, the mouse-port of my (standard) Falcon has this problem: when I have a mouse attached to it, sometimes the right mouse button doesn't work, and when I re-attach the connector to the port the left mouse button doesn't work, or both or sometimes I can only move the mouse in one direction or sometimes everything is OK for a while ...

This happens with all mice that work fine on my ST so I guess it must be some problem with the mouse port.

Any suggestions how to fix this?

thanks in advance,
Dennis

This is a common problem with its older cousins, its caused by the solder
joints fracturing on the 9 pin D plug mounted to the keyboard. You'll have
to strip the keyboard PCB off and resolder them all.

Yes. Take out the keyboard and resolder all the mouse port
connections on the pcb. They frequently develop dry/poor joins
after use. You will probably have to disassemble the keyboard.
Remove all the screws and save them carefully, including the two
larger ones holding down the mouse port bracket. Balance the ends
of the keyboard on two books to lift the keys off the table/bench,
then remove the pcb carefully. You will find some rubber cups will
come off with the print, others will stay on the bottom of the
keys. Replace them all on the keys, remembering that the Return
key has only one cup, though there are two positions moulded for
it. Then resolder the mouse-port connections and reassemble. Make
sure that the keyboard plugs in correctly - on my Falcon there are
2? more pins on the motherboard than in the plug, which fits onto
the pins nearest the front.

Regards, /Peter/

Also remember, TT's with TOS 3.05 generally have 720K floppy where as TT's
with TOS 3.06 generally have HD floppy. Same with Mega STe's and TOS
2.05/2.06. Hence he probably has a 720K floppy based TT.

Not possible. Atari uses a proprietary port on most of their machines
called the ASCI. It's 19 pin and no other machines use it.   The up side is
there are third party devices that allow a standard scsi drive to be used.
Some other external drives such as the ICD FA*ST drives and the Supra
drives, have 50 pin scsi ports on them to allow standard drives. The
devices are the ICD Link and Link II.

Good luck finding someone to part with them. They are no longer made and
hard to find. I recall that B&C had 1 Link II in stock for $149

Hope that helps

Hi,

This may be of use to someone. I was given a Falcon to fix, I think it had been connected to a PC power supply incorrectly. The 5v line was connected/shorted to the 12v.

Falcon didn't do anything, just a black screen with no sync. There was good bus activity, which I believe was coming from the Videl as the address lines were incrementing. After about an hour I decided the GALs were probably dead.

I swapped them for the ones in my Falcon and it booted up, seems to be no other problems.

So it seems GALs are sensitive to overvoltage, I always thought they were. No other chip seems to have been destroyed.

The GALs are completely dead, according to my GAL programmer. I replaced them all (all 5) with four 16V8s 15ns and a 22V8 15ns. I have the JEDEC files here if anyone needs them to reprogram their own. They aren't copy protected.

Not sure if anyone has noticed but it seems the GAL near the keyboard connector, U44 doesn't seem to be on the Falcon schematics. At least, I couldn't see it.

Hope that helps to anyone who may have done the same thing.

Thanks, Lyndon

Is it possible to connect a monochrome display (9 pin subD) to an atari
falcon (19 pin subD)? Is there some kind of adaptor or schematic?

greets, Brrt

Any has tried upgrading the 1mb default memory of a 1040ST ?

I'm going to do this (using 30 pin SIMMs) ... any directions ?

And another question..
somebody knows , how to use a harddisk to the same atari ? i want to use
one, but in my country i cant find atari harddrives :o(

Hi Lyndon, I wouldn't mind a copy of the Jeds. My Second Falcon had a butchered clock mod, and a pin on the Gal was broke. Luckily I had the Gals from my CT2 falcon. But if I ever need to rebuild to stock:-(. Anyway, if you could email that would ease my worries. Good job too, I can't stand to see dead Atari's. Indecently I bought my second falc for 50 dollars AUS (about 20 pounds), and all that was wrong was the Gal and a severed trace on the mainboard. I bought it for parts, but had to at least try to fix it. Anybody have a MegaSTE mainboard they want to part with? Any condition is OK, dead or otherwise.

Regards

Mark

Yes, there is an adapter to connect all ST-type monitors (color and mono) to the Falcon (generally called "RGB adapter"). I think they're still for sale and if you lookup the Falcon pinout as well as the 9 pin pinout on the internet, you can make it yourself too.

Maurits.

I did it and i will never do it again.  Hundreds of pins to desolder and tens or
wires to solder WITHOUT making any mistakes.  It can be done but you must know
exactly what you are doing.  Take a look at this:
http://pages.infinit.net/benoitm/Atari.jpg

>
>And another question..
>somebody knows , how to use a harddisk to the same atari ? i want to use
>one, but in my country i cant find atari harddrives :o(

What is your country?  You must use a true Atari hard disk OR a SCSI hard disk (
rare today ) with an adapter.

Good night!

SCSIs aren't that rare. Besides there is also an internal IDE solution
for ST's (laptop IDE interface for 2.8" harddisks). Is that still for
sale, anyone?

When people are asking for technical help, the country isn't usually
that relevant. They're not expecting a salesperson to reply. :)

> I have one only 4mb STE with the Ideal interface and 4gb drive installed,
> for sale.

Ideal, that's the one. I'd like one in each my STes as well. :)

Why not?

My point being that occasionally they live round the corner, in the next
street or the next town.

Besides running Keychange I use the Atari and Cubase.

I just mean when someone asks "What kind of harddisks can I connect to
my Atari", the most logical next line wouldn't be "I live in Utrecht,
Netherlands". You can't blame them for that. :)

Besides, Atari hardware isn't exactly represented in every country
anyway so people are used to buying stuff internationally..

Hello,

>>hi, i have just purchased a lovely Mega 4 system, rack mounted (Hibrid
>>Arts,Inc) but it is running Tos 1..

>If it's running TOS 1.2 (dated 1987 in desktop info) you could benefit of
>getting TOS 1.4 (dated 1989). This upgrade does not require any
>soldering. I guess most Mega 4 were delivered with TOS 1.4?

Hem... most Mega ST4 (not STe!) were running TOS 1.2, not 1.4.
I upgraded mine with TOS 2.6, which could be switched back to
1.2. I need to search for the schematics, but it isn't hard at
all, and wouldn't lead to any problem, since 1) the chips are
socketed, and 2) you can swith to 1.2 at any time (er... not
while the computer is on, of course!).

>>software or hardware problems that is!!! PS do i need to solder anything or
>>do the chips just plug in?

IIRC, you only need to plug the new eproms into the sockets, but
as these are 32 pins instead of 28 (or something like that),
you will have to solder wires from the MB to the extra pins.
You will have to solder wires from some pins to a switch too, in
order to switch from 2.6 to 1.2.

>TOS 2.6 Can't be used in a Mega ST without an extra add on board so you
>will run into problems, yes.

Sorry, but as I said above, TOS 2.6 can be *easily* used in a
Mega ST (1,2,4) and shouldn't lead to any problem - assumed the
guy hasn't 2 left hands (or right, if he's left-handed ;-)

J.-Luc

Will search for the schematics asap

I live in Trois-Rivi�res, Qu�bec, CANADA. I have a few Megafile 20 and 30 (and a 60, i think) in my museum and maybe i could let one of them go if that is necessary. I think that the Megafile 20 are precious because they have inside a true SCSI to ASCI adaptor wich you can use to attach ANY SCSI hard disk to an Atari.

Good night!

HEY!!! THANKS ALOT! Those sites are extremely helpful.

Last night, I've pretty much figured out how to get it to boot from a floppy and I installed a new(er) scsi hard drive. Its about 500 mg. Is there some sort of limitation to the size of partitions that TOS recognizes? I had some trouble with a large partition of 500 mbs. but I changed them aroud a little and it seems like anything underneath 100 is ok.

Good thing I found that illegal copy of HDDriver. J/K Uwe :)

> > Heya everybody. A friend the other day gave me a TT030 that he had sitting in his closet. I couldn't believe it when I saw and instantly fell in love with it. This is my first Atari and my first experience with the TOS/GEM systems. Does anyone have or could point me to a website that would contain documents that could help me understand the operating system. While I was playing around with it (being a little hasty) I deleted some files from a directory and now I get three bats(?) on the screen and it halts everything from that point. I have absolutely no idea how to use the TOS/GEM system and some of the responses it gives me seems to be a bit buggy sometime. I'm sure that this TT was fitted with an earlier version of TOS, is there any way I can upgrade this? I have an e2prom burner, and was wondering if i could obtain the source of the later TOS revisions and burn it, but finding atari documentations on the internet has proved futile.

I use OE on this gateway box as I've not found any other program that does everything it can do as easy. But having said that, you'll note by the line at the end of this message, not only do I run a good virus protect software, I also went into the dark damp basement of OE & windows and made changes, such as any message that comes in with either a .scr or .exe go's right into the un-recoveable trash can. Then also my ISP has set up virus/spam filters on their users accounts and that is working too, has stopped many virus.

I also changed the default encoding to UUECODE instead of the mime one.

So while I try to find a modem for my TT, at lest this machine has major road blocks set up.

Hi, Lyndon!

LA> I think it had been connected to a PC power supply incorrectly. The
LA> 5v line was connected/shorted to the 12v.

This is what my young brother did to my falcon two years ago - 5V line
connected to 12V line and vice versa.

LA> Falcon didn't do anything, just a black screen with no sync.

Exactly.

LA> After about an hour I decided the GALs were probably dead.

I simply assumed the whole Falcon to be dead :-(

LA> I swapped them for the ones in my Falcon and it booted up, seems to be
LA> no other problems.

I'll try this myself when I'm going home next time...

LA> So it seems GALs are sensitive to overvoltage, I always thought they

LA> were. No other chip seems to have been destroyed.

That makes me hope again ;-)

LA> The GALs are completely dead, according to my GAL programmer. I
LA> replaced them all (all 5) with four 16V8s 15ns and a 22V8 15ns. I
LA> have the JEDEC files here if anyone needs them to reprogram their own.
LA> They aren't copy protected.

I'd have to find someone with a GAL programmer first...

LA> Hope that helps to anyone who may have done the same thing.

Thanks alot for your posting!

Regards,

Alexander

I'm from Chile...
Afaik , here are about 3 Mega ST's , and no other kind of newer atari

I havent found any info about SCSI's or IDE's hd-adapters... or how to
build one..
Some sites still offer Link-2, Link97 , but are quite expensive...
Scsi and ide disk are easy to find... so i just need to find the correct
adaptor (or build one).

Now i'm more interested on upgrading the memory on my 1040STf (and the
520ST)
I've got some docs that describes the entire proccess.. But if anyone
already did this upgrade, i would like to hear some directions on how to do
it.

:o)

Hi,

> I'd have to find someone with a GAL programmer first...

If you want a set done I can do that, only takes a few minutes. If
you have a spare Falcon try swapping all 5 GALs over. It fried all 5
on this motherboard. I'll have to order you some GALs though, I'm
putting in an order in the next few days.

Thanks, Lyndon

I did upgrade the memory of my 1040STf and i do not recomment it. It looks like this now: http://pages.infinit.net/benoitm/Atari.jpg

It takes a lot of patience and a sure hand; if only one of all those solder joints is faulty, then you get a lot of bombs and many hours of hardware debugging.

For the hard disk, your best option is to find a Megafile 20. They should be not too difficult to find and they include a SCSI to Atari adaptor so it is easy to just change the drive for a bigger one.

Good night!

If I'm informed correctly, the Megafile 20 has some MFM/RLL harddisk
(and corresponding interface). All you can replace that harddisk with,
is another 10 or 20MB drive from an XT. :)

The Megafile 44 has a SCSI adapter built in (and uses a Syquest scsi
drive). That interface even has a connector for a second drive and the
case has enough room as well. I have one where the previous owner built
in a 105MB harddisk next to the removable 44MB. Makes slightly more
efficient use of the huge case. :)

Maurits.

> to just change the drive for a bigger one.

Please describe the case of the ...Megafile 20...

In 12 yrs of Atari dealing I don't recall seeing a Megafile 20, only 30 and 60 and the SH 205.

I think you mix it up with the shoebox shaped SH 204, which, whilst containing a SCSI convertor, will not accept *any* SCSI drive, as others here have tried.

If you are into history/collecting then the Megafiles may suit but they are now 10 yrs old and should not be trusted unless fully backed up. If you do buy one make sure a set of earplugs is included!!!!!

You ain't lived until you've heard a Mega ST with two Megafiles daisy chained with the fans all out of tune and cycling....eeeeowwww.

A modern SCSI is the way to go, either the all in one or the SCSI case and Link.

In stock.

My first harddisk was a megafile 20, served me for several years until I
traded it in with my ST and other Atari gear for a Mega STe.

So it certainly exists, as well as the Megafile 44 which I also miss in
your list. :)

Maurits.

Hi, Lyndon!

LA> If you want a set done I can do that, only takes a few minutes.

That would be very kind of you!

LA> If you have a spare Falcon try swapping all 5 GALs over. It fried all
LA> 5 on this motherboard.

I guess I won't go back home within the next three weeks, so don't worry if it takes longer until I can tell you if it was successful.

Yes, I have a spare Falcon, here at my studies-place. No problem to swap all the GALs over.

I just remember that at that time I tried to figure out wether some parts of the falcon would work isolated at home. The 2,5" IDE did not spin up at all (plugged in at the damaged Falcon).

LA> I'll have to order you some GALs though, I'm putting in an order in
LA> the next few days.

Well, I think it always is good to have some spare custom chips for my Ataris, so even if the GALs should not be the problem in this case, it was good to have them. I was pleased, if you could do this for me. About payment and shipping (possibly in combination with the Eiffel) I'd prefer PMs.

Regards,

Alexander

Has anyone written a program to sync a Palm OS device to
ST/Falcon/TT. It would be great to be able to sync to Cardfile 4.

I have just downloaded the demo...
but the demo does not support ZIP drives..
I need the full version...but  also I see that CUBASE (midi software that I
mainly use on my Atari) does not like the latest version..
I was hoping to buy and download HDDriver from their website, but
unfortunately I have to have it posted to me....

is this the only place I can purchase the driver from?

Seems a bit complicated as "syncing" means tampering with various data
from the Palm and without exact knowledge of how the data is organized
difficult to do, I guess...

I can however get my Windows CE computer to connect to my Atari using
tcp/ip over the sync cable using STinG. Makes it possible to transfer
files.

You can even read mail and surf the web, which is impossible using a pc
and ActiveSync!

Instructions for setting this up is on my homepage. I guess things are a
bit different with a Palm, though...

Hello.

You should note that if you still only have a parallel port Zip it will not work on the Atari parallel port.

(Unless someone here knows better.....)

Why do you want to use a Zip instead of a fixed hard drive?

A genuine Cubase will work OK with AHDI and ICD driver software. Mine does.

I may be interested in p/x your parallel port zip for a SCSI zip which will at least put you in the ball park.

hi,

I have a megafile 60 on the STe, but it is nearly full
I need a way of linking my networked PC's to my Atari STe and I have an old
parallel zip drive hanging around..
looking inside the megafile, I can't see a way of replacing it with a PC ide
drive...
and as I have a ZIP on my network...I thought I could at least copy the
files across that way..
any ideas?

Works fine on my STe using the latest HDDriver software.

> is this the only place I can purchase the driver from?

No, as I posted earlier you can buy it from The Atari Workshop in the UK
http://www.atari-workshop.co.uk/

so maybe I read it wrongly... not to worry,..

anyway, I think the end result is that I am not going to be able to use my parallel zip drive on my STE,
and I don't think there is an easy way to increase the storage capacity of my megafile 60 with a standard ide drive...?
in the next few weeks I am expecting to receive a Atari Mega2 computer (with another external HDrive) and a Mega STe with an internal hard drive... I hope to start using the Mega STe for my music (cubase) and I hope I have more luck with the Mega STe's SCSI interface...

id expect you will be hearing from me again very soon...concerning the Mega STe

hi can anyone tell me why sometimes I get two little black bombs appear on
my monitor,
again it's my Atari ste..
I guess this is an indication that the system has locked up....
I just wondered if there was some sort of error code and that I could work
out from this what was wrong?

any help please...
now silly remarks......I'm very new to my Atari (I have spent 8 years
working with PC's and only 8 weeks with the STe)

Two bombs is a bus error. Usually something tried to access memory location zero, twice.

Three bombs is an address error.

More than this is usually repetitions of two and three bombs, although the possible number goes up to 255 for User Interrupt Vector errors. Most of them are no useful except to programmers.

thanks...

would this bus error be due to a software or a hardware issue..?

Hi,

Pilot link has been ported from unix and there is a PIM
called J-Pilot which will run in an X11 Server window
(under Mint). This will sync the Address book, Diary,
ToDo and Notebook but I don't know about Cardfile.

I can sync and back-up my Handspring Prism over a serial
cradle using J-Pilot.

Have a look on the Sparemint pages for info.

Regards,

Peter

If you have PC2002 and Active Sync 3.5 then you do get passthru connection
to the Internet.
You can read your e-mail and surf the net.

With my old CE 2.0 Cassiopeia you can't and I'm using ActiveSync 3.7.
With STinG on the other hand all you have to do is use the Dialer. When
you enable the serial port the Cassiopeia wakes up (if it was powered
down) and when you click connect it gets connected in a couple of seconds
```

ready for any tcp/ip traffic. No extra software needed.

It's a pity the MS guys can't handle that as WinCE 2.0 really is up to the task. I suppose they play with som proxy stuff instead of a real subnet and use som propritaire protocols to get the data over to the Pocket PC.

Some more detail would be needed, what is it you're doing when your Atari bomb's out?.

urbanvelvet wrote:

> but the demo does not support ZIP drives..

The demo does support ZIP drives, but has some general limitations as listed in the README. The demo cannot be used like a fully functional driver, as it is just a demo with limited features.

> I need the full version...but also I see that CUBASE (midi software that I
> mainly use on my Atari) does not like the latest version..

Registered users where the latest version does not work with Cubase can additionally get version 7.9 from me, which will work. The problem with Cubase is that Cubase does not comply to the SCSI standard, which causes problems with modern hard disk drivers.

> I was hoping to buy and download HDDriver from their website, but

> unfortunately I have to have it posted to me....

You can purchase HDDRIVER either from me with a German manual or from
System Solutions with an English manual, just as mentioned on the
webpage. There is no way to download the software. You cannot download
the printed manual anyway :).

You can daisy chain another Megafile 60 onto the one you already have....

In stock.

You can use a genuine copy of HDDriver to format a 100mb zip disc to be Atari/PC compatible, use the parallel zip on the PC and a SCSI zip on the Atari to transfer data.

Yep.  I like STing (http://www.ettnet.se/~dlanor/sting/html/index.htm).
 STik2 also works well.

> some sort of networking software
Not really
> and an email client software..
Yep.  I like MyMail (http://212.214.15.116/~erikhall/programs/mymail.html)
although if you are short on memory Marijuana Mail
(http://www.gregory.atari.pl/mjm-eng.htm) might work better.

Hi

Anyone heard of the Xerox mouse? I've asked about this before but now I have a photo which can be seen here.

www.paraisocz.com/xerox.htm

It's missing the connector which I may or may not have. Need to go through some stuff. Well, I do have another one with a special adapter but it still is not enough to interface with the atari. Might copy that next time if necessary.

But what I may not still have is the xerox paper that makes it work. I use to have it but may not anymore. If anyone knows how to get one please let me know. Or any info leading to specs on this mouse.

This mouse is unbelievably smooth once you get it working.

thnx
dave

I think you will find it is the other way around.

DOS used to format disks and put a "Magic" (random) number onto the disk boot sector, DOS then used this number to detect if the disk had been swaped (in the early days), if there was not a number then DOS thought it was not formated. TOS did not do this and so never put the number in there. I think that the programs that convert the disks simply put a number in, hell, you could probably use KnifeST and add a number. They did do some other things too but I do not think they were required (put in text about DOS version, etc).

Just get a late version of FCopy (or any other simily named app) and they should be able to format a DOS disk for you on your ST.

Are you trying to format 1.44 disks to 720? My XP machine just formated a 720K fine! I did use the DOS format command and it worked, I do not think a 720 option is avaliable from the GUI. If you are going to use 1.44s as 720s then you have to block the hole up with somthing none translucent (in case it uses light and not switch to detact the 1.44 media), this is a nasty method and I would not trust it.

Yes, most Win/DOS machines had some problems with the extended formats, I think this may be down to BIOS, Cheap floppy dirves, bad code. Not sure really but I do remember some machines working and others not.

Elliot.

More precisely, Dos and Windows up to 98 could only cope with exactly their silly specification (wasting two tracks and two sectors, and IIRC no sector interleave), whereas TOS is flexible and adapts to whatever sector layout the disk has.

This is all the more silly considering the fact that Win98 was shipped on extended format floppies, which Win98 itself couldn't read. Disk 1 (normal format) had a hack (not even a real driver that you could use afterwards) that enabled the Windoze installer to read the other disks.

Anyways, yes disks formatted on TOS >= 1.6 should be readable by DOS boxes.

Maurits.

Very wrong... Win 95 and 98 (ME not tested) can read almost anything. I format ALL my disks with FDFormat. Up to 82 tracks, any interleave etc... DOS has no support for thoses format but FDRead in included with the utility.

The incompatibility comes from a slight timing difference between the respectives FDC (Floppy disk controller). DOS and Windows uses the serial number of a disk ONLY to differentiate between disks (Insert the "A" disk in the drive...). Todays Windows can very well work with disks without serial number; how do you want to read your old DOS 3.3 disks with DOS 4???

BTW, i repeat: Windows XP CANNOT format 720k disks, it can only REFormat them! Zap one of your 720k disk with a big magnet and try again... And unfortunatly, XP is not happy at all with extended format disks... I wonder why the removed the 100 bytes or so of code needed to do it.

Conclusion: i now keep a 486 with a 1.44m 3 1/5, a 720k 5 1/4 (yes you read well) with Win95 on my home network and i know i can read or write almost anything brown and round.

Have a good day

Basically true but it can use a program such as MAXFORMAT to do it. I use it
all the time. It won't do the extended format but the standard one works
fine.

greetings again.

Been a long while since I posted anything.. So please excuse me if this has been covered already..

Right now, I'm in the process of rebuilding my atari up to it's former glory. Having gotten an STe, slapped 4 MB into it <aaaah, I remember my Rainbow TOS machine... 1Mb and that was it as I don't solder>.... I have a hard drive and a real time clock on the way. Kobold is also in the works....

However, I would now like to add a CD Rom drive into the chain. All I have is a Supra Hard Drive with it's own controller. I think I have a PCB that's an ACSI controller also.

Question is, can I play around and hook my SCSI drive into the Supra Hard Drive? Can anyone suggest any way of doing it?

Also, and not really relevant, does anyone have a spare ST joystick they can sell me? I can't play Llamatron without it and I so LOVE that bloody annoying game!

Darren

As i understand it, Cubase will not run under Magic, i believe it has its own integral multitasking OS and this wont co-exist with magic.

Sort of makes you wonder what all the fuss is about with MagiC really. After
all, the ATARI is used such a lot for midi work or at least it is by me.
I've heard SO much about MagiC that I had to try it out so I spent good
money but now wonder why I bothered at all when TOS 2.6 wasn't far short of
what MagiC reports to offer anyway.
Ah well, live and learn I guess.

Thanks for the info.

PAUL

You're correct that most MIDI apps require TOS only, but I find
environments like MagiC, Mint, Geneva very useful for other kinds of
 apps. I use a boot manager to boot different setups depending on
 what I am working on. I think you'll find MagiC worth the money if
 you play with it awhile.

the floppy drive(s) are screwed, or the floppy controller.

if they are known good double density disks, there shouldn't be a problem formatting them

What disk are you using, if they are High density that will probably explain
your problem, you need single or double density spec for Atari

>
> Sort of makes you wonder what all the fuss is about with MagiC really.
After
> all, the ATARI is used such a lot for midi work or at least it is by me.

Most Muso's wouldn't bother with things like alternate OS's , they set their
machines so that they work and get on with writing music.

> I've heard SO much about MagiC that I had to try it out so I spent good

> money but now wonder why I bothered at all when TOS 2.6 wasn't far short of
> what MagiC reports to offer anyway.

You couldnt Multi task with 2.06, you couldn't have 200 or more windows open
under 2.06, you couldn't have simultaneous copy/delete operations running
under 2.06 etc etc

> Ah well, live and learn I guess.
>
> Thanks for the info.

Maybe before you put your hand in your wallet in future you could come over
here and sound out your potential purchase, could save you some serious
dosh.

Thanks, Steve. I have! I just wanted to be able to run my word processor

without shutting down Cubase and, from what I read on here, I mistakenly
believed that MagiC could have been the answer.

> You couldnt Multi task with 2.06, you couldn't have 200 or more windows

Using HDDriver 8, it seems to be possible to do this but I bow to your
superior knowledge.

For serious work in Cubase where stability and quick response is
essential it's best to be in single TOS. You might find a suitable text
editor in .ACC format that works well in parallel.

I have used Cubase Score under Geneva/Neodesk and it seems to run quite
well in that environment. Depending on which WP you use ("my word
processor" doesn't tell much...) it might cooperate with Cubase or not.

I actually fired up another TT just now and it is running Cubase Score 2,
That's Write 3, CAB browsing the web and the STiNG Dialer Pinging my
gateway, all at the same time. Cubase does seem to keep its timing but
STinG are loosing quite a lot of IP packets. Maybe beacuse it's connected
at 115200 bps on Serial 2, Geneva has a tendency to stay a little too
long in supervisor mode so the OS can't fetch incoming data on the SCC
chip fast enough (only 1 byte buffer!).

Hm, CAB just exited with two bombs while browsing Erik H�ll's website but
The others still runs fine. Probably lack of memory (4+4 MB)...

HDDriver has nothing to do with number of open windows. Geneva will let
you have up to 99 windows up (if I remember correct...).

>Now you tell me ! :))

Why not enjoy the fact that Atari apps often can be runned under

different OS'es using a "multi installation". Just a quick reboot,
rearrange in the boot selector and the very same apps run in another
environment, be it Magic, TOS, Geneva or Mint!

I have a pc next to me (four computers running at the moment, 3 TT's and
the pc) with Win-98, Win-2000, Win-XP and Linux but they have to be on
separate partitions and can at best share data files. Most applications
must be installed sepatately as duplicates for each OS.

Isn't it a WD-1772???

(that's off the top of my head, so I may be wrong!)

out of curiosity, do you have an external floppy drive connected ?
if so, turn off the computer, disconnect it and try see if the internal now
works.

When my external died, it made both drives unusable till it was unplugged.

I think the problem lies more in the AES-hacks Cubase uses. The integral
OS Cubase uses is MROS but that only applies to MIDI stuff. And on a
side note, it "almost" works under MiNT/N.AES. ;) (It will run but not
completely reliable). It even manages to bypass N.AES'es theme handler
to display its own Cubase-specific look.

Paul Malcolm wrote:

> Sort of makes you wonder what all the fuss is about with MagiC really. After
> all, the ATARI is used such a lot for midi work or at least it is by me.

Well this is just proof that not every Atari user sees the Atari as just
a luxurious sequencer, although some people still seem to think so. Both
MiNT and Magic have quite a lot of serious users who use their Ataris
for quite a bit more sorts of applications.

I was subscribed to the Atari Nederland mailinglist until I was more or
less told that discussing more modern uses of Atari computers were
considered off-topic there. :)

Maurits.

ummmmmm..... ex Amiga user?

St's can only have 2 floppy drives. if yours has an internal floppy drive,
one external is all you can have.

Unless you have made some internal changes in the ST, it will not
read 1.44 meg disks. It will only read 720k double-sided disks or
360k single single sided.

Just for clarifacation:

If you're trying to use HD disks, try covering up the hole opposite to the
Write Protect Tab.

As for controller, the Atari and PC are different in that regard. It's not
simply a case of pull out the old one and put in a new one.. My memory
reminds me that it requires a new IC - I could be wrong.

You could try checking cable connections and ensuring they're snug and
tight.
Also, someone suggested a head clean - that's a really good idea too.. The
heads do develop dirt over time.

Now that I said that, anyone have an ICD Link they don't want?

Darren

Hi Michael

> Any way to hook up a standard 200 or 400 meg hard disk to a atari st 1040?

Quite what you mean by standard i don't know but You would need a SCSI
adaptor such as a Link or LinkII for connecting a SCSI unit, there are
options for IDE drives but they are rare.

Hi all,
I just purchased Atari 520STfm and never had any experience with Atari computers before. When I turn it on, a row of black cherry boms appears across the white screen and refuses to go away. Resetting doesnt make any difference. Is it normal? Does anyone know how to get rid of it? Is there some Key combination to reset/reboot the system?

Thanks,
Gil

Some drives had pull up resistors fitted on the data lines removing them
would have cured this problem

I thought that was the not so common, although preferred for accelerating type, available?.

Not as far as I know, EVERY ST (FM or E) I have, has one, except my MEGASTE and Falcon's of course, who have the Ajax. I did see in an old Mega ST a 1772 02-00 (I think). And once a wd clone but I have forgotten the name of that one, it was quite rare. I think it might be in one of the corpses I have here, I will have a look.

Hi guy's, I seem to remember a post a while ago (which I lost) that indicated it was possible to replace the PAL used for the MegaSTE's 68882 interface, with some LS logic. I have just come by a old mac board which I intend to remove the 68882 and insert in the MegaSTE (All my Falcon's are already populated). Getting a PAL from the US is just a pain, so LS logic sounds good. Does anybody remember this post or have details of it at all? I have tried Google groups to no avail. Thanks, again

I'm not sure, but I think a GAL works equally well. I think the logic
code is available somewhere on the net.

Anyone - is this correct?

Regards

First, I have no technical knowledge on that :)

All I know is I have a PAL, and I got it from Best electronic, when they went to Paris for the last French Atari show.

You need the same one if you install either a 68881 or 68882 in a Mega STE. While the 68882 is supposed to be faster, beware of one thing, most Pure C/Pure Pascal programs will have to be patched (if the programmer didn't use an updated library), otherwise the program just freeze on startup.

Just my 2 cents.

If Cubase allows desk accessories, you could use a DA text editor
while it is running, and then load the saved file later into a
word processor if necessary (for formatting, text styles etc).
EDHAK.ACC is one possibility, and - if it runs with Cubase -
Harlekin's editor is another (however Harlekin hijacks some system
vectors and may give problems with Cubase - anyone tried it?)

It would be nice if Best came to Melbourne:-), I was aware of the c/pascal issues. I have seen the solution, but cannot for the life of me remember where?

Yes, I already know that but I have over 2,0000 files in That's Write format so I need to run that program to use them. The program works under MagiC but Cubase doesn't so I'm stuck with single TOS. Many thanks for the advice though.

<< C302096 or C302434 quite a rare beast. >>

Thanks for the info Mark.
I asked because I have TT which appears to have one of the WD1772 02 02 chips in it.

I wondered why it wouldn't read HD floppies. Now I know ! Presumably I would need an Ajax chip (and a 1.44 Mb drive of course) to enable it to read HD floppies.

  There are a number of solutions around.
  One is called 68882.PRG. You just put that in your AUTO folder, then
forget it. Problem is, some Apps (at least one I am using), then complain
than its code has been automodified.
  The other solutions involve modifying definitely the program. My
prefered solution for this is FPUPATCH.PRG. It's in German, but easy to use, and
very efficient. With it, you can either modify the program, or remove the
calls to the coprocessor alltogether.
  That is basically the two solutions I use.

I am not sure whether 68882 is sufficiently compatible to 68881 so that any TOS applications using a memory-mapped FPU (which, AFAIK, in those days was always supposed to be a 68881) will work. Also, note that a FPU beside a MC68000 is implemented diffrerently- a "memory mapped FPU"- than beside MC68020 and later- a "coprocessor FPU", and programs expecting one of those circuits generally will not work for with another. You might run into some problems there. Another possible embarassment might be the chip packaga- PLCC or PGA; hopefully the package of the FPU of that old Mac matches the one in your Atari.

Anyway, that PAL is basically an address decoder, creating chip-select and data-strobe singnals for the FPU. On a ST/MegaST, making those signals out of A5-A23, FC0, FC1, -UDS and -LDS requires about four 74LS** (or, better, 74HCT**). I did that for a 68881 on my MegaST and it works nicely.
The FPU start address, which has to be decoded, is $FFFA40.

In MegaSTe there is the -IO signal which a is a decoded part of address range, so only about three 74HCT** chips are needed (A16-A23 don't have to be decoded). It is supposed to be something like below, numbers in parentheses showing equivalent pins on the PAL, possibly a small three-chip board could be designed to fit in the PAL's socket (but I didn't test the schematics below, and can't guarantee that it is error-free and it works, as I don't have a MegaSTe):

```

I have a WD in my TT and it does read the HD floppies. There is a micro switch to put to "on" on the motherboard to achieve this, from memory it should be the number 7. The switch is near the front-right part of the motherboard.

Bye,
/Pascal/

I am not 100% sure about the TT, however, with the MegaSTe it can read 1.44
regardless of dip switch settings. The dip switch is purely to set the flag
for tos to enable the "High Density" format option on the desktop. There
could be 2 posibilities why the TT wont read 1.44 disks. 1) it has a 720k
drive or 2) it has a flakey 1772 02-02. I have 2 MegaSTE's both are 1.44
equiped, one has ajax the other has an 02-02. Both work fine with 1.44
disks. If the floppy chip is flakey it would more likely mainifest itself as
data corruption or perhaps lockups. That being said I have heard that around
5-10 percent of 02-02 chips will not cut it at 16Mhz, I have been luck I
suppose all the ones I have tried (about a dozen) work fine.
 Also Steve I checked the MegaST it has a VL1772, these ones I have heard
will cook at 16Mhz.

Mark

There are a few programs that get around the limitation of (actually 6) accessories.

One is a commercial program from Codehead Software called MultiDesk. There's a free one called Chameleon. There are others, both commercial and free, that still have the limit but at boot time allow you to choose which 6 you'd like (basically rename others to .acx).

All worked very well.

- Ross.

Thanks Didier, this FPUPATCH.PRG does it just modify flags like the fastram
flag? The 68882.prg sounds good, as I use boot managers anyway.

Mark

<schematic snip>

First time for everything, will try soon. Have to remove the surface mount
PLCC chip from its mac home first. I think all the Ataris I have seen have
all been PLCC. The only board I have seen different was a photo of the
Sparrow, what about the TT? Thanks

Mark

hi,

we have a Atari Mega STe and we need to check the harddisk, but we have no
checkdisk/scandisk tool anymore. Can anybody send me per mail a tool for
that?

it will be very nice

  No, FPUFATCH (or the other solutions around) are really modifying the
program (a few bytes here and there).
68882 does the same thing, but "on the fly" (like a JIT compiler). For
this reason, the result is slightly slower.

  Yes it does run (and 30% faster), that's what I have in my Mega STE. The
only limitation is that programs compiled with Pure x (with no updated
libraries) have to be patched.

  Hi Pascal,

  Old debate. Some WD work for HD, some don't :)
  That's why I had to upgrade to an Ajax chip.

<< There could be 2 posibilities why the TT wont read 1.44 disks. 1) it has a 720k drive or 2) it has a flakey 1772 02-02. >>

Thanks for all the info. I think the problem is that my TT has a 720k drive. I had thought that all TTs had 1.44 floppies and this is what confused me initially.

I do have a TT HD floppy drive (ebay !) which I will fit and see if that works.

Gordon McCallum

I think you're right about the TT too. Sorry for the wrong hope, Gordon.

>Hi all,
>I just purchased Atari 520STfm and never had any experience with Atari computers
before. When I turn it on, a row of black cherry boms appears across the white
screen and refuses to go away. Resetting doesnt make any difference. Is it normal?
Does anyone know how to get rid of it? Is there some Key combination to reset/
reboot the system?
>
>Thanks,
>Gil
>[please remove DEL from my e-mail address line to reply]

It could mean you have a loose chip. I had the same thing happen
to me. All I did to fix it was to take off the top cover to get to
the motherboard. Then I pressed down on all the chips and I was
able to boot up.

You're right, Didier :)

Even if it sometimes (often) work, the one in the TT I use is going bad,
I think, as I can now just read parts of floppies (both with the 1.44
and 720 drive fitted in my TT). It's even going worth for a few weeks.

Fortunetely, I've got an Ajax. Just need to "find" time to fit it :-)

If i understand correctly that 'only' enables HD formatting in TOS.

You can even use a PC 1.44, the Teacs are very good, easy to modify. They need to be set to D0 not D1. I have one fitted to my second (no defunct - long story) MegaSTE. I milled the front out and actually got a drive with the same shade of grey as the Atari. It looked really cool. Incedently, I don't suppose that anybody has a MegaSTE hard drive Kit? Spare mother board would be usefull too.

Mark

I wonder if it would be possible to disable with a switch, pull 5v down etc.
Have to dig up the schematics again. I like the idea of having it, I would
suspect if an app dosen't call on it at all then no issue?

This you can be sure. If an app doesn't call either the 68881 or the "2" version, nothing will happen, wether they are fitted or not :)

Yes, the 15 pin HD male connector is the standard nowadays. Some old monitors may have a 9 pin not HD connector (I don't know which gender, probably a male one).

> I assume that most VGA/SVGA monitors for PCs have removable video signal

Some old monitors may have a 9 pin not HD female connector.
(my 21" Eizo monitor have this)

Bye,
/Pascal/

Yeah, I drew this up becuse there are so many people asking, I also have the
Falcon clock mods there as well. Eventually I will put up some more circuits
that are simple and useful.

While it is true that most PC monitors don't have speakers some of the new TFT flat screen monitors do come with speakers so perhaps you should include instructions for both, essentialy it will be the same except that you would use a 3.5mm jack plug as opposed to a socket for external speakers.

If by wired in mono you mean connecting to only one speaker you could end up with a lot of annoying noise (hiss) from the other, it would be best to connect the sound to both channels. A direct connection between the channels should be ok as your going from an output to an input but if your worried about it use a small resistor between the signal cable and each channel connection (using amplifiers would be the correct way of doing it). The problem with using resistors is impeadence matching as you can't be sure every set of speakers has the same impeadence however the circuits used are probably cheap and cheerful and so have high input resistors/impeadence thus a value of 1000 ohms will probably work, if they have botherd to match the impeadence this will be too high and you will get very little sound out so try 10 ohms instead. The resistors just provide a little

channel sepperation (electrical not audio) and promote current sharing
between the two channel inputs but as I said connecting both channels
together directly should be fine.

I really think that using 47 Ohm resistors would be a very failsafe approach.

>Does it depend on the receiving monitor in question?

As far as I know- not significantly.

>Surely there must be some signal
>levels I can measure and find appropriate resistors for.

You would need an oscilloscope for that.

>(expensive) high-precision trimpots, or will cheap normal ones do?

That would surely be an overkill, and most probably would even cause a
deterioration of picture quality, because of added capacitance, etc.
(remember, those are not stable DC voltages, but pulses at up to 36 kHz).
And the "best" picture would not even be the same for all viewers- i.e.
I like a slightly yellowish white (the blue component to be somewhat
supressed); someone else might like it the other way. My estimate is that
about, say, 30% larger resistor value for blue signal should be OK.

I got mine for free- well, not exactly for free; I bought the previous owner
a bottle of brandy, and for the price got a 28.8Kbit/s Zyxel voice modem
(model OMNI 288) beside the monitor...

Hello Gerhard,

That is the way they were made. However, there is a way to increase it to full screen, but it involves taking the monitor apart and doing some re-sodering. The best way is to get ahold of an adapter for SVGA monitors that were made by Mario Becroft. They allowed an Atari computer to be hooked to a SVGA monitor, but you would only get the mono mode. Another way is to use a mono emulator using an Atari color monitor. It works, but runs slower.

All of that, just like with a normal bus error. A bus error is a read or write to an address that no hardware is responding to. So this can be either software gone wild (but in an interrupt handler) writing to or reading from a trashed pointer, or broken hardware that gives a timeout on an address.

If everything used to work and this problem started all by itself without any changes to the system, the most likely cause is a hardware problem.

Good luck,

Maurits.

Is a spurious interupt when you have one interupt in service, and you get another before the previous one is finished? I know this wouldnt make a difference with a software interupt unless the interupt handler didnt disable interupts when it starts, but if its a hardware interupt say from the MFP then I would say you have a hardware problem.

Finding out could be tricky. Maybe you can write a little interupt handler in assembler and put the vector for it into the 24 bombs slot (maybe you could dump the memory/registers when it occurs), or you could try running Monst (devpac debugger) in your auto folder, and wait for bombs to occur, it should go straight into the debugger, where you can start doing some investigation.

Maybe.

Smeg.

I'm running Cubase on an STe. The only problem I have is that it sends a blank page to my printer every time I run it. I remember reading about an app that stops this from happening but have no idea what it is or where to find it. Does anyone out there have any more info on this that could help me out?

Many thanks

PAUL

Hello,

in article <bgmmes$oqu$1@sparta.btinternet.com> (comp.sys.atari.st.tech), Smeg wrote on Mon 04-08-2003 22:24 (GMT):

> Is a spurious interupt when you have one interupt in service, and you get
> another before the previous one is finished?

Yes, it looks something like this: a bus error during an interrupt (as
I found in some docs).

> I know this wouldnt make a
> difference with a software interupt unless the interupt handler didnt
> disable interupts when it starts, but if its a hardware interupt say from
> the MFP then I would say you have a hardware problem.

I think it's a hardware problem, indeed.

> Finding out could be tricky. Maybe you can write a little interupt handler
> in assembler and put the vector for it into the 24 bombs slot (maybe you

I stop you here: I'm not able to do that, unfortunately.

> could dump the memory/registers when it occurs), or you could try running
> Monst (devpac debugger) in your auto folder, and wait for bombs to occur, it
> should go straight into the debugger, where you can start doing some
> investigation.

I can read the memory/registers when it happens. "Problem" is that they
are a lot different from one crash to the other. And it happens
randomly, I cannot reproduce the problem applying some proceedings or
protocol. For those reasons, I think it's probably a hardware problem.
I'm a little bit clueless but I do not lose hope to find the solution.

Well...
Thanx for your help.

Bye,
/Pascal/

Hi, I would like more information on the way to modify the monitor to increase it to full screen. Is there a document describing in detail how to do it?

Thank you

Its a problem on the MB. The solution was to use another MB :-)

On Atari-related ftp sites wyou should be able to locate documents describing the adjustment (no soldering needed) for increasing picture size. As far as I know, it is not practical to increase to real "full screen" (because of focusing problems- picture will not be so good either at borders or at the centre), and you will have to keep borders of about 10mm (also convenient because picture position may shift a couple of mm with temperature, etc.).

Look as well for the document describing how to rectify a fault which may develop soon after you increase picture size: there is a bipolar 2.2uF electrolytic capacitor which is overloaded and very prone to blowing- it should be replaced by a real non-polarized 2.2uF capacitor (this involves soldering).

I am not at all sure about the advice for replacing the 2.2uF horizontal flyback circuit tuning capacitor. I tried replacing it with a physically smaller one, and it overheated. I believe it needs to be bipolar, because the yoke windings swing both ways with respect to ground.

The problem with that cap is that it is too close to a heat sink, the one for the horizontal driver transistor. It dries out.

The solution is to mount it on the bottom side of the board. If you have one that has not failed yet apart, move that cap to the bottom side of the board.

But I would not recommend using a polarized capacitor. I have used a wrapped up bundle of polycarbonate capacitors, adding up to 2.2 uF, on long wires and stuffed up under the front of the tube. Polycarbonate is non-polar, but expensive, unless you have a friend with a bunch of them.

Of course, you can try a polarized one and see what happens, but I would not mess around in that circuit, because failures are expensive.

Jim

AFAIK the problem with electrolytic capacitors is that they have larger
disipation factor than other types and heat-up nicely.

>I believe it needs to be bipolar, because

Of course, but that is exactly what I suggested, but maybe didn't make
myself clear: non-polarized, non-electrolytic one. See below:

>: Look as well for the document describing how to rectify a fault which may
>: develop soon after you increase picture size: there is a bipolar 2.2uF

>: should be replaced by a real non-polarized 2.2uF capacitor (this involves
~~~~~~~~~~~~~
~~~~~~~~~~~~~

Btw. newer non-electrolytic 2.2uF capacitors can be quite small, and not
much bigger than electrolytes.

Hi folks,

I need some information how the printer port is implemented on a standard
Atari ST in hardware.
According to the knowledge I already have, it seems to be a bidirectional
port in the soundchip and some pins on the MFP.

Any information and pointers appreciated,
Matthias Arndt

5.3. Parallel Interface

The ST parallel interface supports Centronics STROBE from the YM-2149 PSG for data synchronization and Centronics BUSY to the MK68901 MFP (ACKNLG is not supported) for handshaking. Eight bits of read/write data are handled through I/O Port B on the PSG at a typical data transfer rate of 4000 bytes/second.

----- Parallel Port Pin Assignments ---------------

```
             ST          DB 25S
                          ----                                ----
          PSG I/O A         1 |---- Centronics STROBE ---------->|
          PSG I/O B         2 |<--- Data 0 --------------------->|
          PSG I/O B         3 |<--- Data 1 --------------------->|
          PSG I/O B         4 |<--- Data 2 --------------------->|
          PSG I/O B         5 |<--- Data 3 --------------------->|
          PSG I/O B         6 |<--- Data 4 --------------------->|
          PSG I/O B         7 |<--- Data 5 --------------------->|
          PSG I/O B         8 |<--- Data 6 --------------------->|
          PSG I/O B         9 |<--- Data 7 --------------------->|
          MFP              11 |<--- Centronics BUSY -------------|
                        18-25 |---- Ground ----------------------|
                          ----                                   ----
```

Signal Characteristics

pin 1	TTL levels, active low.
pins 2-9	TTL levels.
pin 11	TTL levels, active high, 1 Kohm pullup resistor to +5 VDC.

9. I/O Map

The ST I/O space ranges from ff 0000 to ff ffff, with MC68000 and MC6800 peripheral internal registers starting at ff fa00 and ff fc00 respectively. Accessing reserved I/O addresses will result in a bus error. Bit values for various read and/or write registers are labeled as active One/_Zero (always mask out unused field bits). The following is a map of ST I/O space:

```

```

10. Interrupt Table
The following tables list the ST interrupt and signal priority assignments:
----- MC68000 Interrupt Autovector ---------------

Level	Definition
7 (HIGHEST)	NMI
6	MK68901 MFP
5	
4	Vertical Blanking (Sync)
3	
2	Horizontal Blanking (Sync)
1 (LOWEST)	

NOTE: only interrupt priority level inputs 1 and 2 are used.

----- MK68901 Interrupt Control ---------------

Priority	Definition	
15 (HIGHEST)	Monochrome Monitor Detect	I7
14	RS232 Ring Indicator	I6
13	System Clock / BUSY	TA
12	RS232 Receive Buffer Full	
11	RS232 Receive Error	
10	RS232 Transmit Buffer Empty	
9	RS232 Transmit Error	
8	Horizontal Blanking Counter	TB
7	Disk Drive Controller	I5
6	Keyboard and MIDI	I4
5	Timer C	TC
4	RS232 Baud Rate Generator	TD
3	GPU Operation Done	I3
2	RS232 Clear To Send	I2
1	RS232 Data Carrier Detect	I1
0 (LOWEST)	Centronics BUSY	I0

NOTE: the MC6850 ACIA Interrupt Request status bit must be tested to differentiate between keyboard and MIDI interrupts.

hi,
I need to replace my hard drive cable (from my STE to my Megafile 60)
as it is too short...
could anyone tell me what type of cable / connectors do I need..

is there a PC equivalent I could use?

thanks in advance...

There is no equivalent. If you are good with a soldering iron, you can replace the connectors of a printer cable.

Hello,

You may want to try looking that up in the online Atari
Compendium at the site below:

http://www.fortunecity.com/skyscraper/apple/308/html/toc.htm

I would email Best Electronics. They should have, or at least, be able to build you another cable. Goto their website using the site below:

http://www.best-electronics-ca.com/

Uwe,
         Can you tell me what drivers are needed to run a CD rom with the ST? This isn't any drive though, it's a Pioneer 6 disk changer. Is the Atari able to address each disk as a separate device?

```
Thanks

I am sorry but I cannot answer this question. You should ask the authors
of CD-ROM drivers for the Atari as it depends on their software how such
a device can be accessed.

hi,
thanks for your help on my last topic...
you know who you are... ;-)

this time I'd like any help on connecting a zip drive to an Atari ST,

can it be done?
I have an external 100MB zip drive (parallel port)..
has anyone managed to make this option work?

again I thank you in advance for your help..

A SCSI Zip connects directly to the Falcon. With the original TOS I had
to format each disc as four 30 MB drives.

Yes, needs an DMA->SCSI apdator external (like LINK 97, ICD or others)
and an hard disk driver.

> I have an external 100MB zip drive (parallel port)..
> has anyone managed to make this option work?

The one and only -parallel port- interface for the atari rom port was
made from woller/germany. I don�t know they have interfaces left.

> again I thank you in advance for your help..

It�s better to ad SCSI drives.

Rgs, Robert

not possible, been asked before, iirc the Atari's printer port is of a very
average design with the bare minimum of pins connected, not sufficient for
such devices.

I wonder if the IDE version would work with an IDE interface.
both

http://gem.win.co.nz/mb/atarihw/ide.html & www.keychange.co.uk

do IDE interfaces but I can't see any mention of ZIP drives there.

Yes, they will, as an internal ide zip drive with a disk inserted is recognized as a 100mb hard drive on any computer. It just wont find it when there's no disk inserted, unless there is specific support for zip drives.

Hi everyone

I now have access to my Atari Software/Hardware stuff and will try to compile a list of everything I have for sale. I have mostly software. If you need something and know it by name, it would be best for you to tell me what you want.

As I said up top I will create a list but this might take weeks and maybe even months before it's completed.

I am still pulling stuff out my storage but have lots here with me as well. I am sorting things out.

Email me privately if you are interested. Again, I apologize in advance if I cannot find what you need up front, but I might still have an idea if I do have it and will try and locate it or let you know if it will be a wait.

Or simply wait for the list.

Thanks
Dave

I seem to recall that it is indeed possible. Roger Burrows at
Anodynesoftware.com would be a good person to ask.

True, but there was an improved parallel port adapter for the cartridge port, which did work.

The driver software was not up-to-date, though. It was proprietary and did not implement several standards like XHDI or the SCSI Driver interface, which are useful for any kind of device.

ISTR that each disk position receives its own LUN, with the entire device
being addressed by its SCSI ID. So no 1 could be 3.0, the second 3.1 and so
on.

Hello,

Yes, I am sure it can be done. All you would need would be
HDDriver as the hard drive software. I have it on my STe and it
functions great. I also have it on my Hades in which I also have a
Jaz drive install. Works great....

I believe that Extendos Gold has this option. I would contact
Roger Burrows at Andyne just to make sure.

I have a 1040ST that upon coldboot shows a flickering display. Not read bad kinda like someone was jiggling the cable all the time. As the machine warms up it gets less and less evident to an almost normal state. Any ideas as to the cause? I reseated all chips!

Tim

Hi Edward S. Baiz Jr.
is there a chance you could email me HDDriver?

I have a megafile 60
and I it uses a driver called " Atari Hard Disk Driver" I thinks it flashes
up AHDI when the hard drive boots up..
it's very quick so I cant read it..!!

many thanks...

atari@urbanvelvet.co.uk

hi,
yet another post...
I have an US robotics external modem..
how can I set up my ST to dial into my email account..
I guess I need dial up software
some sort of networking software
and an email client software..
does any of this exist
and if yes has anyone got a copy they would be prepared to give/sell me?
thanks in advance..

It is still commercial software and the latest version can be bought in the
UK from The Atari Workshop at
http://www.atari-workshop.co.uk

Hope this helps

HDDRIVER is commercial software, not a free product, so mailing it to
you would mean to spread illegal copies.
You can download the demo version from
http://www.seimet.de/hddriver_english.html. The web page also contains
information on where to purchase HDDRIVER.

This is where I started: http://www.flinny.demon.co.uk/ the home
page for STik. Lot's of good resources. I ended up using STing for
the dialer/TCP-IP though: http://sting.atari.org.

HDDriver is a commercial program, so I could not do it. There is a
demo of it on Uwe Seimet's website that you could try out.

Thanks for the help so far but I still can't recover the music datafiles.

AHDI 6 identifies the drive as a Conner but when I install drive C it comes back with "this drive does not exist".

Is there a way to reinstall the partitions without losing the data? EQ.

One can do this with special floppy disk/hard disk tools. In contrast to SCSITOOL or HDDRIVER, where one can recover lost partition data, AHDI does not offer any means to recover data.

Hi,
anybody willing to lend a hand to port TOS (or to be precise EmuTOS) to the Qx0 platform? I've done some work with EmuTOS but I am way over my head due to lack of time. Check out the Qx0 platform at: <URL:http://www.q40.de/>

Hi,

I tried replacing the TOS 1.04 in my STF with a two chip solution and also failed miserably, though I was not aware of the jumper situation. I presumed my attempt had failed due to the STf being slightly different to the original ST in configuration and having had a blitter fitted in it by an earlier owner. I presumed on studying a two chip STFM with TOS 1.02 that the two chips would go in the 1st and 4th sockets out of the six sockets which O presume are in the same layout as mine and on the left hand side (with the disk drive etc to the rear of the machine). Don't asked why I tried this, but I quite wanted the machine back in its original state (I've enough 4mb 1.04's lying about).

regards,

Thomas

P.S. Sorry to the chap I mailed this to by accident, I hit the wrong button in Inward Express ;-)

I am trying to set up a CD Rom dribve on an ATARI STe with Tos 1.6
using HDDRIVER v8. The system recognises the drive but that's it. How
can I actually access the drive? I tried using drive "U" but that
didn't work. Any help would be greatly appreciated.

TIA

PAUL

Use the hard disk driver for your hard disk.
Any CD-ROM need an CD-ROM driver like SPIN, ExtenDOS

Does anyone know where I can get a copy of ISO9660 for use with SPIN?
With Atari being so sparsley supported these days it's almost
impossible to find anything!

Many thanks

You need a CDROM driver, not just a hard disk driver. I cannot find you
in my database of registered users of HDDRIVER, by the way. Can you
please send me the serial number of your HDDRIVER?

```

i found a 520stefm at a flea mkt for $5 it powers up the leds flash on n off
then on the floppy i think makes some noise but no video i run the rca into
a apple ii monitor and a tv but nothing. im kinda handy with messing around
with old macs but i dont recognize any of the ports on this or even how to
get the case open my google searches get a lot old fod memories but few
useful tech help

thanks for listening
george

the rca socket on the st, is RF out, its a modulated video and audio signal
for a television tuner to receive.
you must use the monitor socket if you want composite out, there are pinouts
on the internet.

as for opening it. remove all screws, except the 3 long ones under the
floppy drive. its very straight forward after that.

I think your 520STfm is fine, you just need to connect it to a display
correctly. Get a TV switch box and you will be able to use it on your TV.
There is no Composite out on that RCA it is RF Modulated video only, you
will need to build a Composite out from the ST Monitor port if you wish to
use it on a modern TV with RCA video.

You can get a cheap ST Monitor, that is what I recommend, I have some for
sale!

I like the look of this site, it seems to have lots of translated software
in its archives, some well known names as well.

What's with that club that's mentioned on your site?.

Does anyone know where I can get a copy of SPIN later than 3.4? I believe it's upto 3.7 or higher. Can't find any reference to any version other than 3.4 and I can't configure it properly to run with HDDriver and Metados no matter what I put in the config.sys file.

Many thanks

PAUL

I've done it! The problem was that my first Hard Drive was set as SCSI ID 0 rather than 1. I'm on a learning curve and apologise for any inconvenience caused as a result. The STe doesn't have an SCSI port and I'm using The Link 97 but no-one seems to have published any tutorials about how to actually set things up (not on an idiot's level anyway).

Thanks for all help and support.

PAUL

Hello,

in article <aaeohvo430mtjhqrh50k6laif6032o6r8b@4ax.com>
(comp.sys.atari.st.tech),
Paul Malcolm wrote on Mon 21-07-2003 19:06 (GMT):

> Does anyone know where I can get a copy of SPIN later than 3.4? I

I thought that there was a later version than the 0.34 one (not 3.4) but

I was wrong. The author told me.

Bye,
/Pascal/

I'm confused, I can't see that making any difference at all. Sounds like maybe you've tweaked ID settings at a hardware level to suit what your configuration file states. Still, if it works...

> caused as a result. The STe doesn't have an SCSI port and I'm using The Link
> 97 but no-one seems to have published any tutorials about how to actually

That bit is plug and play, and the rest is ensuring that at least one device is proving TERMPWR to the external bus (look in the jumper field description in the data sheet), there are no overlapping IDs, and that only one device is terminated (last device on the chain). Job done.

As for the actual Spin! CD driver, it isn't that easy, but with perseverance!

The Extendos commercial driver has an automatic setup.

--

Cheers

Derryck

Including the English installation text and test and utility programs for the Magnum ST RAM upgrade, and a whizzo utility for using an ST as an SLM laser printer server with any computer that can send HP-compatible print date out of a serial port (tested on a PC).

> What's with that club that's mentioned on your site?.

Funny you should mention that, the next meeting of the Cheshunt Computer Club is tomorrow the 23rd of July, at the Garden Room, Wolsey Hall, Cheshunt, Herts. Quite near J26 of the M25 motorway in fact.

Dare I say it, the only Atari-supporting club left in the UK??

I was of the impression that there was a later version, available on registration/payment of a shareware fee!

I suppose that the author knows best, of course :-)

Tim,

How much for an ST low/med capable monitor shipped to US zipcode 19446?

Thanks
Mark

Woh!, i was looking for a free cuppa, could you stretch to that?.

That's local to just about anywhere in Kent and Surrey, a short trip for

South, East and North London and a bus trip for essex!!.

Cheshunt Computer Club, the most essential accesory for any Atari user?.

> Dare I say it, the only Atari-supporting club left in the UK??

Woh!, that's some achievement

Yes, that's the version I was thinking of! The nice thing about it that with HDDRIVER it can access data (not audio!) CDs without an XFS driver. Or was it one of the other driver support files that is not required anymore? I have to admit, I don't know anymore ;-).

I think you mean this:
-------------------------------cut---------------------------------
XFSs
____
In addition to this mode, SPIN! now also supports a mode where MetaXBS is completely bypassed. In this mode (which doesn't require anything MetaDOS specific as CONFIG.SYS or METAXBX.PRG), SPIN! will solely use the harddisk driver to access the CD ROM. This requires that the harddisk driver allows to mount a CD ROM on a GEMDOS drive letter, and that it allows to read 2048 bps sectors (again, see recent HDDRIVER 7.54 and later). Also, under this mode, SPIN! can't support anything related to CD audio or multisession disks. However, it is a very useful mode to conserve RAM and to get things up very quickly.

Yes, exactly! This is a nice features for those who only use data CDs.
It is also interesting for those who have a DVD-ROM or PD drive, as they
can map the CD-ROM drive letter and the DVD/PD drive letter to the same
letter.

Well it may cost as much as shipping. I think Shipping is like $25-30 so
$60 shipped?

I have the JVC Style for sale.

Tim

Hello Paul,

You need to get a driver for the CD drive like Extendos Gold. That is what I use and it functions great. I also have a STe with TOS 1.6 and use HDDriver.

Hello Uwe,

US> With MagiC or MINT you can read and write PC-
> compatible FAT or FAT32 partitions.

That's interesting. Would I boot the MiNT kernel from a small TOS partition and then have that mount a larger FAT / FAT32 partition? If so, is that also the way that minix (I don't know what other filesystems MiNT now supports) partitions are handled?

I would be interested in learning how the Atari boot procedure works. I think the PC loads a master boot record from the first sector of a hard disk, and then runs it. If I understand correctly the master boot record contains (or perhaps loads) a partition map. Unless a boot selector program (e.g. bootselector, lilo) is in that first sector the partition that's marked 'active' has its boot record read, and then executed.

Does an Atari hard disk driver include a boot program that gets loaded from the disk and then executed, or is the driver more like a library of routines that TOS calls to access the drive? Perhaps both of those things?

US> Without MagiC or MiNT you can create a single (!)
> partition that is both PC and Atari compatible with
> HDDRIVER.

That's nice, I can imagine that being quite useful.

US> Note, however, that only one partition per hard disk
> drive is possible in this case. As the maximum
> partition size for the ST is 256 MB and for a MegaSTE
> /TT is 512 MB you would not be able to use the full
> capacity of your drive.

You mentioned that the 256 Mb ceiling was imposed by a (19-bit?) sector count limit. Is the 512 Mb ceiling similar or is it geometry related like PC IDE's old 528 / 504* Mb limit?

- Andy Ball   *(504 Mb if 1Mb = 2^20 bytes)

Yes, it basically works this way. There must be at least one normal TOS
partition to boot from. The filesystems on the other partitions can be
of any type.

>
> I would be interested in learning how the Atari boot
> procedure works. I think the PC loads a master boot record

There should be loads of information about it in the internet and it has
been described numerous times in Atari-related books. It is basically
the same as with a PC.

> Does an Atari hard disk driver include a boot program that

The driver is loaded by TOS and then executed. When it has initialized
TOS continues with the boot process.

> You mentioned that the 256 Mb ceiling was imposed by a

The TOS limits have nothing to do with the drive type or geometry. TOS
and the FAT file system simply have internal limits wrt sector sizes and
the maximun number of sectors.

Andy Ball wrote:

> FAT32 partition? If so, is that also the way that minix
> (I don't know what other filesystems MiNT now supports)
> partitions are handled?

Yep. It also supports Ext2 (which was the standard for Linux until Ext3
came up.. no driver for MiNT for Ext3 yet I think) :) and I believe
there are also experimental drivers for AmigaDos and even Mac HFS IIRC.
It's a long time ago I heard about those though, and I never saw a use
for them so I have no idea if that ever got any further. :)

Also NFS (network drives) and the ramdisk work that way.

Actually, other than in most other unices, MiNT doesn't really have a
"mount" principle. Any drive that is recognised by a driver, gets a
directory in drive U: (and in most cases, also its own drive letter,
although not NFS for example). The "mount" into the root filesystem is
not much more than a symlink to the drive folder in U:.

On a side note, as soon as (or: IF) I find the appropriate documentation
for it, I'm going to try to write a MiNT driver to see the Siemens S55
(and probably other mobiles as well) as a drive. Interesting experiment. :)

Maurits.

Surely the wheel has been invented????

You'll be doing this after you've brought the UK links page up to date, since NONE of the current links work or are relevant.

Leaving bad info on the net is annoying, irresponsible and a waste of dial-up time.

It don't show the Atari community in too good a light either.

If you can't be bothered correcting your errors take the lot down.

You've summed up yourself in a sentence, something I've tried to do for some
while.

> It don't show the Atari community in too good a light either.

And you've given yourself an encore.

> If you can't be bothered correcting your errors take the lot down.

What witty retort can i add here.

Hi Steve,

>>If you can't be bothered correcting your errors take the lot down.
>
>What witty retort can i add here.

I know one:-)

Barrie is absolutely right, and Hallvard should surf immediately to the
Keychange website to see how things are done correctly. We all know that
the Keychange site is an example of a well constructed website, it's not
only pleasing to the eye, but in addition the wealth of information simply
drips from our monitors.
The Keychange website has truly set a standard that is very hard to follow
A lot of brave men have tried, only a few have mastered it...

Cheers from belgium
Dennis

The last time i looked at it i got the impression that someone had shit in a puke puddle and photographed it.

I'm off to shag a sheep, while bazza shags his hand some more.

Hi all,

Does any one know what can be the cause of 24 bombs, aka spurious interrupts ?

This happens on my Falcon from time to time.

Bye,
/Pascal/

Hello,
  in article <bgd7l5$141$1@news-reader4.wanadoo.fr> (comp.sys.atari.st.tech),
  Nspirit wrote on Fri 01-08-2003 10:16 (+0200):

> "Falcon with Napalm" From Mark Bedingfield in comp.sys.atari.st :
>
> >> http://members.optusnet.com.au/~atari1/bombs.htm

Merci :-)

But this is this a "description", it doesn't explain anything. I have a
more complete description : "spurious interrupt, bus error during
interrupt process".

The question remains:
What can give "bus error during interrupt process" ?

Software or hardware problems?
Interferences? Bad solder?

Bye,
/Pascal/

If anyone know of a Mega STE for sale with or without other hardwares, I
would like to know.

Thanks
Dave

It's been a while since I've powered up my Mega STE and I'd like to
get back to playing with it.  Are there any monitor adapters out
there?  I tried contacting Mario Beachcroft of NZ, but he doesn't
reply.  Thanks!

Jim

www.keychange.co.uk supply SVGA adaptors properly buffered and with sound output.

```

My hard drive won't boot on my newer system but the floppy boots ok. My HD booted fine on the old system. Notator launched fine from floppy on this newer machine.

I guess I can check the host configuration on both machines and maybe other hardware on the motherboard.
I wonder if maybe the TOS is different on this new machine and why it won't boot?

I am using ICD Host 6.5.5 and can run for instance ratehd and idcheck but I cannot even install/reinstall the icdboot.sys. C is greyed. No other app will find the drive. The same app formatted the old Mega.

I opt not to reformat this drive. I have way too many important files on it. And yes many backups on floppy but won't want to chance it until I double check that I backed up everything. A long [very very long] journey.

The shorter journey would be to make this Mega boot my hd. I know it can. Last resort is reformat I know. I will be checking other options tomorrow but if anyone has input, my ears are open.

Thanks
Dave

Anyone with a Falcon for sale might get a good price at NAS2003 as there
most likely will CT60 acc. on display there.

Btw. check out http://www.sak.nu/ for details on the event!

Hi,

I have a 1040STf that is dead. I get two bombs on screen with a beep when turned on. I found that TOS chips not seated can cause this so I took the system apart and reseated the chips to no avail. I also tried this: I removed the 6 TOS chips and powered up the ST and I got a blank white screen. Can this be a indication that the TOS chips were causing the two bombs? If it was something else wouldn't I still get bombs on screen?

Tim

The tos chips are probably running if you get 2 bombs, are you sure you got
the HI and LO the right way around ?  are you trying to boot with a floppy ?
faulty boot sectors can crash the ST.

Thanks guys. Well it's in Gothenburg on the west coast and I'm in Uppsala on the east coast so... but thanks anyway. Well, let's see, if noone's interested then I might keep the stuff and use it for *something* whatever that might be. Build my own home alarm system or whatever :-)

Definitely - the TOS chips *are* causing the bombs, since they contain the code that draws them on the screen ;-)

However, that does not indicate they are at faulty, probably more the opposite.

Try extracting/re-seating all socketed chips (and other connections - RAM add-in boards etc.), especially the square PLCC ones. Cleaning the contacts of the PLCC chips and their sockets with a glass-fiber eraser might also help.

Before taking all of the chips out you can try the classic atari drop.
 It sounds weird but I have used it a number of times on cranky
```

machines and it works. Lift the computer about 3 inches off of a hard surface and drop it onto the surface. This tend to reseat the chips. If you open the case and push down on all of the non-socketed chips you can get the same effect. I have a towered MegaST and because the case stands the motherboard on its side the chips come loose frequently. I just open the case (while the power is off) and push the chips back into their slots. It works.

It works up to the point your PCB fractures, it wont after that.

This has got to be the most useless and potentially destructive bit of
shitte ever written.

Only for a short time. After that, you will have to re-do the procedure, and
soon you will have to take out the chips and clean the pins anyway.

Yes the chips are in correctly, all in order. I disconnected the floppy as
I have the machine in pieces, trying to isolate the problem. I am wondering
if one of the TOS chips is causing the 2 bombs... With 6 chips it is hard
to tell. What else can cause a Bus Error?

I should point out that shipping a complete mega STE from the UK to the US
is about $60 US.

Small parts cost less to send.

Very unlikely, especially if they are ROMs (as shipped by Atari) and not
EPROMs.

>What else can cause a Bus Error?

Nearly anything on the board - a bad contact anywhere, faulty Glue, DMA,
MMU, CPU (unlikely), or a bad TTL or memory chip.

Most likely is a contact problem.

If the machine comes up far enough to display bombs, a test with the atari
diagnostic cartridge might help to diagnose the culprit.

If you find nothing in that area, you have to start swapping chips - MMU,
Glue, DMA are socketed and easy to check. Do *not* mix IMP and non-IMP chips
- they may or may not work, so this is not good for checking a faulty
machine.

I also have a working 520STfm, I am thinking of trying to swap out chips to
see if I can isolate what is wrong with this 1040STf!!!  I wonder, can I
easily upgrade my 520 to 1MB from this 1040????

Some 1040ST motherboards had 2 banks of ramchips soldered into the motherboard under the PSU, 1 Bank on the left for 520ST and both banks filled for 1040ST. If you are lucky and have got a 1040 that has got the second bank in sockets, and your even extremely more lucky in the fact that your 520 is the same type of motherboard then you could take the 2nd bank of memory out of the 1040 and put it in the 520. Dont forget that there are a few resistors as well that will need to be added. You will need good soldering skills in order not to fry the memory chips when putting them back in (though really you should buy some more sockets and solder them instead).

I wouldnt bother though, as its easy enough to make a 1mb upgrade for your 520, and after all this it could be that the RAM in the 1040 is bad, and maybe that is why its not working.... ;-)

Smeg.

Nor can I, but why? If for a TT, which it is, it is a VGA monitor, and it is a 14-inch diagnonal VGA monitor, and does TT Low and TT Medium, and any

```
VGA monitor does the same. Probably they were made, and I suspect, and
hope, that B&C has some in stock, but they are VGA monitors, and any VGA
monitor will do. I have used a yellow and green VGA monitor on my TT.
Looks strange, works.

Jim

Well upon further investigation of my (newly aquired) 520STfm it has 1MB
already! The top row of chips is socketted and populated with ram! So the
banks are left/right and not top/bottom?

Thanks
Tim

I swapped most chips from the 520STfm to the 1040STf and still the same
problem. Two bombs. So atleast the TOS is good in the 1040! I may use the
TOS in my 520ST, though I think having the Boot ROMs is kind of cool, but
makes the machine useless with only 512k!!! ;)

Tim

I heard there was a TOS .9 something or other boot disk for the early 520STs that did not have TOS in ROM. Is this the verision of TOS shipped from Atari? Or was it 1.0? Does anyone have a image of TOS .99 or the official one released by Atari Corp? I have a 520ST and need a TOS Boot Disk as I lost mine.

Thanks
Tim

Is there a floppy in the drive?.

Describe /exactly/ the sequence of what happens from the point you switch on.

Try leaving it powered up for an hour and then power cycle, it may be a
power supply problem, leaving it to warm up may aleviate that.

No doubt Sweetie Pie will give you the 13 pin din, 15 way Hi D socket and hood, short length of cable and a few components for free as well. He'll lend you his soldering iron, wire cutters and give you some solder, too.

To be really FREE he'd even make it for you and post it wherever.

By all means make stuff if you have the knowledge, time and confidence in your ability.

Unlike yourself, you'l cut the bits off some old shit in a skip and charge
for them as new.

> To be really FREE he'd even make it for you and post it wherever.

I'm not gonna rob him like you offered to. This is publicly available
resource youre ripping people off for.

> By all means make stuff if you have the knowledge, time and confidence in
your ability.

He doesn't need knowledge, it available on the web for nowt, time is
something most people have in abundance and confidence comes with doing.

If you listen to people like this, you will never achieve anything, except to empty your wallet on a non-appreciating loser. If you have to use him then by all means....

Making an adapter is a piece of cake, but understand that its only for a mono hi-res screen, and you may have to put a trimtool inside the monitor to adjust the H and V size/pos, like I did with mine. You could make an adapter for colour, but unless you have an old colour VGA monitor around that does a 15khz H-sync (they only do >31khz these days) then youre SOL. In this case the best bet is to out look for a Philips CM-8833 (MKII is better), atari SC1435, or Commodore 1084S colour monitors.

Oh you might want to take a look at www.1632systems.co.uk for monitor cables etc, I think he also ships state-side.

Smeg.

When I switch on I get a beep and two bombs at left center of screen. White background.

> Try leaving it powered up for an hour and then power cycle, it may be a
> power supply problem, leaving it to warm up may aleviate that.

Well I swapped a PS from a 520STfm and it did the same so the PS is fine.

It must be the RAM at this point.

Tim

any SVGA monitor will work happily on one, they have the matching 15pin vga
plug.

Generaly monitors meant for pc's will just need the picture moved
horizontaly, as when plugged into a TT it will be way off the side. This is
all on screen nowdays.

Yes. However, it need not be faulty RAM chips: a bad MMU, GLUE, bus driver chip, or a bad connection on the board may cause the same error.

Lost me there, your point?

Anyway, who rattled your cage?

> Making an adapter is a piece of cake,

No, it's a plug, a socket, a hood, short piece of cable and some components.

Hope your cage door is locked.

You and your ilk can pop at me as much as you wish, it worries me not a jot.

BUT, the people you mislead may just give up on the Atari.

cables
> etc, I think he also ships state-side.

Come on, pillock, do you want Jim to achieve something and make his own
cable for free or not?

Hope they threw away the key.

No "may" about it.
I've been driven out of c.s.a.s. and now this thread has driven me out of
c.s.a.s.t. as well.

Congratulations all.

David,

I have two motherboards populated with 4 megs RAM, but they need TOS chips. Should power up and work but I can test them with my own TOS before they leave. I should also be able to draw up two brand new power supplies to give with them. Let me know if you're interested as testing will be a hassle.

Thanks

Jim,

Listening to this pointless fight will get you nowhere. To put it simple there's two ways:

1) A VME video card, as in the one that Mario Becroft is selling. It will be hard to get ahold of one there. I have an AlberTT that I would let go of for $200 but to be honest, that is a complete rip off as this card is crap. I simply want to hold on to it for rarity value so the price has to be right for me to let go. Best bet is that someone surely somewhere will sell off a Crazydots card. Mario's card has good reviews from people who have it but I too have not been able to reach him :-/ The point of the VME video card is to get higher resolutions and color amounts.

2) The more simple way is simply to build an adapter that displays NORMAL ST resolutions on a VGA monitor. The simplest of adapters can display Mono only and works
on most monitors (all that I've tried my adapter on), or you can build a color adapter but that only works on a few monitors as mentioned. Barrie from keychange is selling the adapter, or it's a fairly straightforward build if you go that route. I found the easiest method for me was to hack a VGA cable apart and solder directly to the underside of my Mega STe's motherboard. now it just has a VGA cable coming out and a switch on the back to determine color mode (use with TV) or mono mode (use with vga port). The bonus is that my monitor port is still free too.

Keep in mind the Mega STe has a good RF modulator on it and as well you can extract composite video out for plugging in to the TV. You can't do this on other models that aren't STe IIRC. Many many ways to get a picture off that machine, just up to you to choose which one is your way.

No need, really... Just filter the worst of them out. By adding "X-No-Archive: yes" to the filter all remailer posts go to the bin as well.

I have no use for these people as I probably know more about Atari computers then they do...

You didnt give me the impression it was a linearity problem, i took a prompt
from your description of 'shadow', if the picture is non-linear then yes,
you need to look for scan problems.

> Is this a common fault on monitors? I sort of remember that I have seen
this

What I'm describing, in the most extreme could get as bad a having a grey
scale from left to right, full brightness to cut off .

L.EGAL C.A.B.L.E TV DE-S.C.R.A.M.B.L.E.R

Want to watch Sporting Events?--Movies?--Pay-Per-View??

*This is the Famous R-O Shack TV D.e.s.c.r.a.m.b.l.e.r
You can assemble it from R,a,d,i,o S,h,a,c,k parts for about $12 to $15.

We Send You:
1, E-Z To follow Assembly Instructions.
2. E-Z To read Original Drawings.
3. Total Parts List.

**** PLUS SOMETHING NEW YOU MUST HAVE! ****
Something you can't do without.

THE UP-TO-DATE 6 PAGE REPORT:
USING A D-E-S-C-R-A-M-B-L-E-R LEGALLY

Warning: You should not build a T.V D.e.s.c.r.a.m.b.l.e.r
without reading this report first.

You get the complete 6 page report "Using a D-e-s-c-r-a-m-b-l-e-r LEGALLY",
the instruction plans and theeasy to follow diagram all for just--$10.00

Fill out form below and send it, along
with your $10.00 payment to:

SMG PUBLISHING INC
1340 East Vine Str #218
Kissimmee Fl 34744

(Cash, Check or Money Order.)

(Florida residents include 7% Florida State Sales Tax)

(All orders outside the U.S.A. add $5.00)

Hi

Remind me what this game was called, I think I got the demo on a
coverdisk from STFormat or ZERO: It was quite polished, two player,
and a puzzle game where you had to arrange the yellow shapes.

The gameworld was quite purple, the screen divided in two down the
middle. You ran back and forth along the bottom of your half of the
screen grabbing
falling shapes and putting them in your big matrix, trying to copy a
shape from memory before your opponent did the same.

While the game was loading there was a little band (bongos, guitar and
funky bass) that played to you.

When you finished a level there was a sample in a croaky "cool" voice
that said "hey guy, you got it...", and text that said :"(...said the
great priest)".

It then stacked up a load of coins depending upon how well you played.

Please visit this site and see some (very artistic) pictures I've
drawn of the game to jog your memories!

http://www.asktoby.com/atari/atari.html

I *know* you tried this game demo out on a coverdisk. STF, I think?
Maybe ZERO Magazine.
Go! Look! Remember! Tell me what it was called! Tell me what disk it
was on!

Thanks

Toby

Hm - a bad (leaky) capacitor could cause this behaviour, but it is unlikely
that tha card has a capacitor from the video output to GND, so it might as
well be the DAC itself :-(

cu
Michael

> did not see a fuse but I will check.

I'll be suprised if there is no internal fuse. But then again, over
here -there kinda picky on that - 'everything' needs a fuse!

Check the capacitors on the supply too - if any are even slighty raised,
then its usually a gonna (and sometimes causes the fuses to blow). If the
caps are bad - just replace them with same type (the voltage can be higher,
but the fahrad rating must match as close as humanly possable)

Dan.

Ok I checked and there is a fuse in the P/S.  It looks fine.  The keyboard
does not have a fuse at all.  I really hope it is the PS that is bad.  I
ordered a new PS it should be here any day.  Normally  if a computer like
Atari/Commodore shows no signs of life it is the PS right?  (ie no power
leds, etc)

Does anyone know if it is possible to use a keyboard from an Atari STfm computer with an IBM-clone type system. I'm thinking of taking a Laptop with a broken screen and damaged case and putting it in the body of an Atari. I figure that this might make a few heads spin at my local computer club (most of us used to have Ataris).

I'm figuring that a Laptop would probably be the best way to go since it is already fairly compact and it would already have a power supply that I could move into the case. I doubt that the Atari power supply would be sufficient for a PC.

I know that there is a keyboard adapter that allows you to go the other way (use an IBM keyboard with an Atari. Just wonder how hard it would be to reverse-engineer something like this).

Interesting, this would probably be the first case of the Atari keyboard being better than the original PC's :-)

> I'm figuring that a Laptop would probably be the best way to go since

On the contrary. Most laptops either take just 12V and convert it inside (its easier to make cigarette and airplane type adapters that way) or just 12V and 5V, which is what the ST supply gives. Laptops are designed to run on low power so I dont think it will be too much for the ST's PSU (and you wont be running the LCD screen either I guess). I cant remember off the top of my head what the specs for the ST's supply are, maybe someone else here knows then we can work it from there.

Most importantly though, if you do use the laptops PSU, wire it up to the original atari psu switch in the back! The illusion will be much better :-)

You would have to convert the Atari keyboard's protocol to the one that the laptop uses (PS/2?). Suggest using a PIC processor for this - you should be able to find all the scancodes and such on the 'net.

Could be a nice project, except that you aren't the first with this idea ;-)

You could replace the guts of the ST keyboard with the internals from a cheap PS2 keyboard. I've been thinking about this myself, as I have a dead 1040STF that would be ideal to house a Mini-ITX motherboard and then run Linux + Aranym on...

You mean just replacing the PC keyboard caps with the ST keyboard caps?
Wouldn't work entirely, to my knowledge. I think keyboard layout is
different and some keys on the ST keyboard do/did things differently.
But... if not, and it fits (without having to hack the case to bits to make
it fit), then... great! Let me know how this goes and link to a few
pictures. I'd like to see it!

Hello one and all.

Got hold of TT today at long last.
It had 4mb TT ram on a card, as soon as I got it, I put in an 8 mb simm, which worked, then added the 4 mb too and 12mb TT ram was recognised, only problem is, I plug my trackball in and it only goes up, down and left. If I unplug it, the re plug it, it goes up down and right only. Plug a mouse in, works all ways, but very irraticly and intermittently. (trackball worked fine in another computer)

I took the extra 8 meg out (72pin simm) and it works smoothly... There are dip switch setting on the card, but I'm not sure what they're supposed to be if I go put this amount in, anyone any ideas. (I realise I may be a little lacking in info here, so if I need to add more, tell me what to go look for)

Rob

No, I mean gutting the ST keyboard and wire the matrix to the keyboard processor from a PS2 keyboard. I don't know how straight-forward it would be, and it will definitely need a custom keymap.

If I do this project I would want to use the original Atari keyboard
that comes with the Atari, otherwise it wouldn't look as interesting.
 I'm thinking that the Laptop powersupply would be the way to go since
the ATari power supply would probably be in the way of something in
the case (it is fairly large and mounted on the Atari motherboard).

If I can figure out how to remap the keyboard and can get a cheap
broken laptop then I'll try and decide how much I want to keep the
computer looking like an Atari. I may go the semi-easy route and
cut-out most of the back of the case and have the connectors from the
laptop visible. This would be easier than trying to make them fit
into the holes of the existing connectors. I also have to try and
decide if I want to try and put a CD drive in the system. I may just
hook one up externally via USB or Firewire.

The big problem will probably be trying to get a laptop without having
to pay an arm and a leg

Might change the impedance too much. Better try a 470 ohm pot in series with a 47ohm resistor directly from red to GND.

I have a Atari colour monitor in the attic (a SC1224?, the one with same case as SM124). I'm wondering if it has a composite video input or if it's possible to build a circuit that gives it composite video so I can use it when I'm editing video.

Any pointers, ideas anyone?

/Jocke

For ST keyboards like in this case yes, but frankly the Mega STe / TT
keyboard is the best keyboard I've ever used, except maybe Sun keyboards. :)

Maurits.

Hihi

Got an Atari 520STFM here that I bought for �1 off eBay believe it or
not

It has had the floppy upgraded and a small daughterboard for four 30pin SIMMS to upgrade the memory

When I got it, two slots were populated with 256K SIMMs gving it a (whopping) 1MB of RAM

Took those out and replaced it with 4 1MB SIMMs but I only seem to be getting 2.5MB RAM and on closer investigation two of the sockets appear to be being ignored, I've been told elsewhere that you can add 4MB to this machine putting it on par with a Mega ST 4, but it doesn't seem to be the case, does anyone have any clues as to why this happens? (I can open the machine and have a closer look at the expansion board if needed)

Thanks

--
Enzo

:)

I agree, I have two of these keyoards, one on my Mega STE and the other on
my Falcon.

Smeg.

You need to disable the onboard 512KB of RAM. You can do this by
pulling the RAS and two CAS lines to 5v. You should see three
resistors, I think 33 ohm. Snip the ends and solder wire to a 5v

point.

Hi!

Perhaps I should direct this to Lyndon Amsdon personally, but maybe there is someone else here that has any ideas concerning my problems with my falcon, so I decided to post it here. :)

I'm struggling with what I believe is a faulty cartridgeport. I'm trying to use the EtherNEC with my falcon, but this hasn't been successful. When I run HT1ENEC.TOS for diagnostics I get 0xff only on the first line, and then I get 0x00 on the rest. And after a couple of seconds I get an Illegal Instruction exception (four bombs, anyway). It says in the documentation that I should get 0xff all the time unless I short circuit one or several of the data lines.

Obviously this is the reason why I can't use the EtherNEC with my falcon, but what could be causing this?

I've had a look at the schematics of the falcon around the Cartridge port. There aren't that many types of signals involved: +5V, GND, D0-D15, A1-A15, UDS, LDS, ROM3, ROM4.
I've checked that the port gets +5V (on pins 1-2), and the 74LS245 on the EtherNEC board gets it too.
I've also checked the ground and it looks OK.
I haven't checked D0-15 because they are directly connected to the 030, so I figured that if something is wrong with those, the whole computer should be dead. The same reasoning applies to A1-15 and UDS and LDS, I think.

This leaves ROM3 and ROM4, which come from the COMBEL if I'm not

mistaken. Could these signals be faulty without the whole COMBEL being
bad (dead)? I think it sounds unlikely. And the COMBEL is alive,
otherwise my falcon would be dead.

So what am I chasing here? Any ideas?

Regards
Henrik

Henrik,

More likely the problem is the ISA NE2k card. Is it an authentic RTL8019 card or is it another brand? If so, which kind. I've had varying mileage with other NE2K compatible cards, most of that mileage being of the "it doesn't work" kind, and I have tried 10 different kinds of cards before giving up and getting the card the board was developed with, an RTL8019 based NE2k card.

Thanks
Mark

Hi Mark!

According to the documentation I'm supposed to run the test program
"HT1ENEC.TOS" without the Ethernet card attached to the EtherNEC, so I
think this shouldn't have anything to do with the actual Ethernet
card. It might be that the Ethernet card isn't working either of
course, but I won't discover that until I've managed to run
"HT1ENEC.TOS" as it should...

And I'm pretty sure that Lyndon tested the entire kit before he sent
it to me...

I assume you have the EtherNEC too. :)
What values do you get if you run "HT1ENEC.TOS" without the Ethernet
card inserted into the EtherNEC?

Regards
Henrik

I havent looked at the Schmatics for the ST but the falcon does differ depending on what market it is destined for, though this only affects the modulator output, not the VGA AFAIK.

> What about the hires mode? Is this independant of which country the
> machine resides in, so the rates are always 35.72 kHz hor./71.3 Hz vert.

I think thats correct, Hires was designed for the SM124 or vice versa, and I dont think this monitor is any different wherever you buy it (except for 240/120V supply of course).

> Another thing.... since it's now hard to find VGA/SVGA monitors which

> the RGB input of a SCART connector to get a very good colour picture (as
> opposed to using the RF output -or is that really a "composite video"
> output signal?), or would a colour monitor still be superior to this,
> can one be found?

Yes, its quite easy to make a cable to connect an ST to a scart socket, I remember doing it way back in the early 90's with my STE, it gives a good picture, as its using the RGB and not the composite output its better than the modulator, but no where near as good as using a proper RGB monitor such as the Philips CM8833 or the Atari SC1435, or Commodore 1084s. This is because even though the TV is decoding pure RGB from the ST, the tube resolution is still very low compared to most old computer monitors.

The ST generates an composite signal which passes to the modulator, which is then modulated to a particular RF frequency, then the TV demodulates it, to get a composite signal again. This involves some loss of qualtity as you may guess.

> As for SCART connectors: this is only a European phenomena, isn't it?
> TVs/VCRs in the rest of the world don't have them, do they?
> What kind of solutions can they use, if there aren't any SCART
> equivelants available in those countries?

I wouldnt call it a phenomena, every TV, DVD, Cable, Sattelite decoder and VCR that is shipped in Europe nowadays has at least one SCART socket. SCART is the best thing to happen to us over here as far as home entertainment equiptment is concerned and its a shame the Yanks/Canucks missed out. From what I remember other areas without SCART have the usual RF and maybe composite and then SVIDEO, and some high end TV's I have seen with component RGB. SVIDEO is good, not as good as component RGB, but its rather hard without more electronics to convert existing equiptment to use it. I think to use this with an ST you would have to build an RGB to SVIDEO converter box. Maybe you can buy these things over there pretty easily, I havent seen them over here (UK).
Failing that, its possible to isolate the modulator inside the ST, and take a coax cable from the Composite encoder chip (2 pins) and feed that outside of the case. If your TV has a composite input then you have a winner.

Smeg.

The colour modes are a problem for the reasons mentioned.

>I'm a little puzzled as to why there are TV standards involved. Why is
>there talk about NTSC and PAL here? Are there minor differences in the
>output circuitry between Atari ST computers in North America/Japan
>(NTSC) and those sold elsewhere in the world (PAL)?

The reason is that many games players didn't have a monitor, but used their TV sets, fed via the aerial (antenna) input. Yes, STFMs etc. were supplied with different modulated video outputs for NTSC-lands and PAL-lands - I think this lies in the modulator 'block' itself. Apart from the scanning standards differences (525/60 & 625/50), there is also the colour modulation type (namely NTSC and PAL!) and the fact that NTSC RF output is in the VHF band while the PAL one is in UHF.

Colour monitors fed with RGB/Sync gave vastly superior results, and AFAIK all would work with both 525/60 and 625/50, with slight screen size differences. They are almost essential for serious work, including word processing etc, as the image on the TV is too fuzzy for prolonged reading.

>And what about countries like France where SECAM is used?

Not sure - they *may* have used SECAM, or PAL (many French sets were dual standard so that they could pick up other countries' transmissions, although the 'purists' fought against this!).

>What about the hires mode? Is this independant of which country the
>machine resides in, so the rates are always 35.72 kHz hor./71.3 Hz vert.
>no matter what?

Yes. HiRez does not come anywhere near the modulator, it's straight video out.

>Another thing.... since it's now hard to find VGA/SVGA monitors which
>handle the low frequency of 15.xxx KHz, wouldn't it be possible to use
>the RGB input of a SCART connector to get a very good colour picture (as
>opposed to using the RF output -or is that really a "composite video"
>output signal?), or would a colour monitor still be superior to this,
>can one be found?

Yes - my Philips CM8852 is fited with a SCART socket that I use with STs and via a SubD->14p DIN adaptor on my Falcon. This monitor also has a TTL RGB DIN-socket, and there is a moulded legend 'RGB CVBS IN' and a blanked-off space where a socket may be fitted in some versions, presumably, for composite video (CVBS stands for Colour, Video, Blanking, Syncs).

>As for SCART connectors: this is only a European phenomena, isn't it?
>TVs/VCRs in the rest of the world don't have them, do they?

That's correct. Furthermore, not all SCART leads are 'full' leads and some may only have composite video connected! Also some, mainly older, TVs don't have RGB inputs. either.

>What kind of solutions can they use, if there aren't any SCART
>equivelants available in those countries?

Maybe some have Super-VHS 4-pin DINs for separate colour and video signals - but that would need an adaptor from the Ataris. Other monitors, and perhaps a few TVs, also have BNC-type video inputs although that is mainly a professional solution. Perhaps one of our US members can give more info on this?

What program are you using with the EtherNEC? I have gotten it to work using STing on my STe and another friend used MagicNet on his Falcon. Once you setup either program, then you can activate the card. Do you get a green and yellow light with the card plugged and the Falcon booted up?

I would say that 4K7 is a mistake. The p-p voltage is only 1v rather than 0.7v. On most monitors this shouldnt even cause a problem. If its found that when a pure white screen is obtained that artifacts are noted on the screen, then I would go with 47R - 270R to start with and go from there.

Oh, and the audio signal, well I have had that pin sent to the SCART socket of my TV which is line level in, and it worked perfectly. Any Falcon owner would probably scratch their head if you ask them what Atari corp means by "line level". ;-)

Well I survived using a TV for 3 years. I was mostly a games player back then, only started using a monitor after a long time of programming 68K (worrried about my eyes;))

>
> > The ST generates an composite signal which passes to the modulator, which is

I think thats right. I heard about the existance of a STM but never confirmed it.
Europe modulaters would output a PAL tv signal, and the US one an NTSC signal, and they are radio frequencies. You connect the modulator output to your TV via the Antenna socket.. The confusion comes because the ant/modulator socket looks like it could be a composite video socket.

> And as for the "composite" signal; is this the same as "video out", such

> separate "video in" connector?
>

Thats usually just called "VIDEO" or on my philips monitor its labelled "CVBS" and on a lot of equiptment (VCR's) its a Yellow phono jack the same type as the AUDIO left and right jacks, though I think the way the Atari composite is wired is a slightly different concept - see below.

>

Sorry, I thought you were Stateside for some reason... cant think why.

> video", but in parathesis it says: "(where applicable)".
> Does this mean not all STs have composite video on this pin?

Quite possibly - its probably country specific. The composite video signal
probably only carries the video portion of the signal, and you may need to
wire up the syncs aswell, they can be mixed together into "composite sync",
which though not politically correct, you would just twist the 2 sync wires
together and solder them to the composite sync input in the scart socket,
and you would wire the comp video line to the corresponding pin. If you use
the seperate R,G,B, H and V SYNC lines instead, you may have to mess about
soldering resistors to a few pins in the scart socket (IIRC pins 8,13 and
20) in order to get a picture, this all depends on how the scart is
implemented on that particular TV.

Would this work? I have some old 520ST TOS Boot Roms and was wondering if
they would work on a 1040STf?

Tim

Hi! A 1040STf is just a plain 520ST with 1 meg of memory (instead of 512k)
with the power supply and a drive included in the same cabinet. But if i
remember well, some came with only two ROM sockets and others came with six...

Also, all 1040 came with ROMs (the first 520 did not) so why do you want to
change new ROMs for old ones?

Have a good day!

Well I have a 1040STf here with no ROMS, but 6 empty sockets and I tried the
Boot ROMs and it did not post.

IF
the ROMs are goods
AND IF
each of them is in the right socket
AND IF

```
     they are correctly oriented
THEN
     It should work!
ENDIF
```

(believe me...)

But, as they have redesigned the PCBoard, i am not sure that ROM no. 1 in ST is no. 1 in STf. The new arrangement may be 1,3,5,2,4,6 instead of 1 2 3 4 5 6. The fact is that ROMs comes in pairs, the high byte then the low byte. You cannot harm them by swapping them but beware of static electricity!!

Good Luck!

I may be missing something here, but I do believe that the ST, not STE, had sockets for six roms, and could take a four rom set.

It was tos 1.4 that came in either six rom or four rom sets. A quick look into service information does not indicate that this part of the board layout changed.

Also have an STe, and that takes a two rom set.

I know I have one of each, st and stf, but the one I have apart for headscratching activities is a six rom set.

If nothing else works, post again, and I will take another one apart.

Jim

Hi "Hallvard Tangeraas"

> The confusion concerns the following pins of the VGA connector which go
> to ground as they're not used in all the diagrams I've come across:
>   - 4 (Sense 2/ID bit 2)
>   - 5 (Self test/TTL ground)
>   -11 (Sense 0/ID bit 0)
>
> So should I connect these pins to ground as well, or leave them alone?
> Some diagrams use them, some leave them out.

I think these are only of use to older video cards who try to work out what type of monitor is connected

> There's also some disagreement on whether to use resistors on the R/G/B
> lines, and if so, which values they should have. I've seen 47 Ohms and
> 4.7K Ohms being mentioned.
> I guess this is to lower the rather "hot" signal from the Atari ST,
> making it more compatible with standard VGA/SVGA, right?

It could be for 'weighting', the eye likes to make white light from video signals of

30% Red
59% Green

11% Blue

So with video signals of 1V black level to peak level you'd need

0.30V Red
0.59V Green
0.11V Blue

fed to the video amps to make a human perceivable peak white signal.

You're right! I now remember that there is jumpers in the ST to select between 32k and 64k EEPROMs (or is it 64k and 128k? 16k vs 32k? Damn, where are my schematics ?!??!!??)

Tim, are you listening?   I think you have a little detective work to do...

Good Luck!

I have a Conner 3040 scsi drive which seems to have lost its partition
table, as in when I try to open C it returns " this drive does not exist"
HDDriver won't see it at all but ICD pro identifiies it as a conner 3040
with partitions C,D,E, and F.
It had 4 partitions on it originally. There are some songs I really want to

retrieve, any ideas please? EQ.

Yeah,

I had a problem with one of these in my Stacy the other day. As soon as I booted AHDI 6.06 off floppy the drive was visible. You will need to boot the AHDI then install the driver on the harddrive with the AHDI tools.

Get AHDI from ftp://pub.atari.org/

Smeg.

Exactly! HDDriver is not 100% compatible with the Stacy Conner drives. I
could not partition the drive with HDDriver. AHDI works but I used
Diamond Edge instead.

After that it works OK to install HDDriver as harddisk driver. Strange...

All schemes for such connections that I have seen used resistors with values below 100 Ohm. The interesting bit it that, if a colour monitor is used, values for the three resistors should not be the same, in order to obtain a properly balanced white. Otherwise (with all resistors equal), IIRC, there is an unpleasant bluish tint to the picture.

It might also be worth mentioning that perhaps it would be more convenient to use a monochrome (S)VGA monitor- because in ST-high resolution patterns are used very often (instead of different colours), and those patterns do

not interact well with the dot pattern of a shadowmask picture tube- a moire
forms on the screen, which may be annoying (the moire effect is probably
sess visible if the monitor has a much greater resolution than ST-high).

Indeed, as partitioning does nothing but writing sectors to the drive,
like any other write operation. In other words, if you can write sectors
you can also partition. Guess you have missed something when partitioning.

Beware: there are jumpers on the board to select between 2-chip and 6-chip ROM configurations (and also 4-chip, but I think that noone ever used that). Find the schematics on the'net (they can be found). Also, try to find some docs which will tell you which pair of the six sockets is to be used for a 2-chip configuration (most probably that would be in the schematics as well). Maybe the tables below will help, but I can not gurantee that they will apply to your machines. Note that the starting address for ROMs is $FC0000 and that is where the 2-chip set should go (i.e. socket enumeration goes sort-of backwards). Unfortunately there were changes in enumeration between different board revisions.

I understand that you have only -boot- ROMs, not complete TOS ROMs, but I presume that they would be equivalent to a 2-chip TOS-ROM configuration.

Well, AFAIK the Stacy host adapter is the same as the M/STE's, my own M/STE
has HDDriver 7.8 on it, and its worked fine since I bought it. When I got my
Stacy it booted up with HDDriver 8.02 IIRC, I downgraded it to 7.8 and could
no longer see the drive. After many configuration attempts it was still
touch and go whether HDdriver even saw the drive in the ID table, though it
would detect it on boot up more often than not. Not to disrespect HDDriver,
because its definately the best disk driver around, but as soon as I put
AHDI on the boot sector, now it works, everytime.
I wouldnt ask you for support, because both versions of HDDriver I got with
the machines I bought (though i deleted 8.02), so Im not sure if I actually
own copy or not.....

Smeg.

Any legal copy of HDDRIVER comes with a disk with a serial number on it.
If you don't have any serial number information and if you are not in my
database of registered users (I don't think you are) your copy is not
legal. It does not matter whether you got it with your Atari or not, the
only legal proof of a legal version is the serial number.

My 520ST seems to be dead! It was running and when I came back into the room the computer looked turned off. But was switched on. Black screen and no leds on. It seems to be not getting any power! Can the PS be dead? It is the large Atari external PS. It is a 7 pin female connector.

Is there a way I can test to see if the PS is bad before I shell out $40 for a new one? I noticed that the SF 354 had a similar connector but only 5 pins, the 520 PS has an extra +5 and Ground, so I plugged it into a old SF354 and the drive made a weird noise, just like a bad SF354 PS I had! Should th drive work with the 520ST PS? This would be a good test since I have no volt meters or the knowledge to test the PS at this point!

Any help would be great.

Atari ST forever!
Tim

Can someone provide some guidance on how to adapt a PC Power Supply to connect to a Atari 520ST? The one with no Disk drive that requires a external PS! I know it needs +12, -12, +5, and -5 and Ground, is that right? Can I just splice up a cable and connect it to the 520? Not really qualified on this type of thing but am willing to try!

Thanks!
Tim

There posting history. Lazyness and abusive behaviour is not hard to spot. They don't deserve any direct help and it's unlikely they will come up with any information of interest to me.

Instead of leaving c.s.a.s I prefer to filter the worst out to save time and make the group a nicer place for myself. I mostly use http://google.com when searching for answers myself so I don't think I miss much.

Bang on Mark. However, you can get composite video out of any Atari ST, except the ST, STF, and MEGAST. The composite is avaliable as long as there is a modulator in the machine. At least that's what I have been lead to believe. I don't have any of the above. I have done this on STFM's and MEGASTE's and STE's before and it works a treat.

Mark

Is there an origionalist reason to continue with this old machine?

Surely moving on to an STE would be an advantage.

Does the 520ST need -12 and -5V? Im asking cos the 520STFM/E doesnt. If not
then its a simple question of using the reds on the PSU for 5, the yellows
for 12, and the blacks for 0.

Sorry Hallvard, SOL is a yank phrase meaning out of luck - sorta.

No the horizontal freq for RGB monitors is 15.725Khz or thereabouts, the same as TV. Older VGA monitors will do this, but newer ones wont as VGA uses 31Khz. Vertically yes its not a problem as VGA monitors old and new will handle 50 or 60hz no problem.
The mono frequencies are similar to VGA, but the horiz freq is slightly off, hence sometimes you will need to adjust the monitor when using it on the atari. 72hz is not a problem for most VGA monitors, but it may default to a 60hz mode if its one of the older monitors and you could get a shrunk screen vertically which you may or may not be able to adjust to full height.

Smeg.

If there is no modulator in the a particular ST then I guess that means that there is no encoder chip on the mobo for it either. It may be a simple hack to make a little composite vero board, or you could just take the RGB signals from the back into an external composite encoder box. Seems like way too much trouble these days though....

Smeg.

Here's a question...

Could you use a DSP (Digital Signal Processor) to take the original ST video resolution signals and "amplify" them to the higher frequencies of a standard SVGA monitor, making it possible to use a normal SVGA monitor on an ST? Just wondering, since a DSP deals with (processes) digital information...

>As far as frequency rates go, I thought 31.5 KHz was the horizontal rate
>for the Atari ST. Is this incorrect?

Hi, Hallvard;

Yes, you are in error here. Horizontal sync rate for monochrome is about 35.7 kHz (I strongly suspect that it is obtained by dividing 32MHz ST system clock by 64 and then 14) and about 15.1 kHz for colour; the first one seems to be acceptable to most (S)VGA monitors, the

second one is acceptable only to some multisyncs and to a fair
percentage of old monitors.

>As for the vertical rate, this is as far as I know 50 Hz (or 60 Hz,
>depending on where in the world you are) for colour (low or medium)
>modes, while 72 Hz is the rate for mono (high).

More-less correct. Vertical frequency in monochrome is obtained by
dividing the horizontal frequency by 501 (number of scan lines, though not
all are visible), and it is about 71.3 Hz.

Assuming the PC supply provides sufficient amperage (and I'd suspect
it does) it really is just a matter of connecting the proper wires.
The PC supply may need the +5V "always on" line connected to a ground
line depending on the model, but that's the only real difficulty. Try
to find a PC supply with an on/off switch if you can.

I'd wager that they don't need the -12 or -5.   I know the MegaST
doesn't. Our computer club is going to be doing away with a bunch of
STs (the type with the external power supply). We could make you a
real good deal on a power supply and even an extra ST.

I won't be able to get to the computers until our next meeting though.
 They are stored at the church where we have our meetings.

dave

Thanks Dan. I checked the Supply and there is no fuse. I will check the
520. It is a US model. I had it open the day before and put in TOS 1.0 and
did not see a fuse but I will check.

It is weird as the ST hs getting no power so I suspect the Supply being bad.
I might have a lead to a working one that does not exceed the price of the
Computer! LOL

Thanks
Tim

The MegaST has an internal DC/DC converter for the RS232 voltages, the 520ST
doesn't (if memory serves me right), so it probably needs the -12V.

>As far as frequency rates go, I thought 31.5 KHz was the horizontal rate
>for the Atari ST. Is this incorrect?

Yes, it is! The ST range uses TV resolution for medium and low rez: in PAL countries 625 (lines) * 25 (frames) = 15.625kHz, in NTSC-land it's 525 * 30 = 15.75kHz. (The frame rate is the vertical rate, or course.) This is too low for all but the oldest VGA or SVGA Multisyncs to handle.

For ST high rez it's 501 * 71.3 = 35.72kHz, which is within range of SVGA monitors.

Regards, /Peter/

jot.

Im not popping at you, specifically, just the whole group of atari retailers
who are there trying to squeeze every last penny out of atari users.

Obviously im talking about system solutions/Atari Workshop, and other people who say they have something to sell, then when you ask them about it, they get all cagey and dont really answer your question, or they accuse you of pumping them for information so they can "cherry pick" on ebay...

> BUT, the people you mislead may just give up on the Atari.

Im not sure what you mean.

He wants a VGA adapter. I have suggested buying an RBG monitor second hand, and looking at 1632 for the correct cable if its not included with his purchase. I thought you would be able to follow this far, though from the few emails ive actually recieved from you it seems you have an acute attention disorder, so I forgive you for calling me a pillock.

> Hope they threw away the key.

Who cares. I can pick any lock.

Smeg.

Anyone know what type of 30 pin simms the ST/e will take?   I want to blow
it out to 4 megs but, I'm not sure what flavor of ram to use.

Thanks

Mark, Smeg, and Barry:

Thanks for the replies. It's a shame there was some flaming, I hope
that dies down.

Like I said, it's been a while since I played with an Atari and it
looks like I need to read up more before I jump into this. I am an
electronics tech, and should be able to hack something together once I
get some free time, but since time is an issue, I may get the adapter
Barry is selling then use the info listed earlier to make something

better once I get the time and motivation :)

I take it there are limitations for the adapter that Barry is selling.
It works for Mono Monitors only and I may need to tweak the monitor.
I need to look at the apps I want to run and see if they work in Mono
mode or not. I'm mainly using my MegaSTE to play with 68000 assembly
and it's sort of a low priority right now.

What is the situation with Mario Becroft? Is he still selling his
products or what? Cheers!

Jim

Not correct.

The current SVGA adaptor I sell is used solely to connect a colour SVGA to
the Atari using hi res monochrome.

No colour. I can supply another hi res adaptor for the older SVGA mono
monitors, there is a difference.

The new 15" and 17" monitors that I supply for use in hi res with Cubase etc
need no internal
tweeking and the picture has only a (deliberate) 1cm border.

Jon,

Any 30pin 1mb simms will do, 8bit, 9bit, 2 chip, 3 chip, 8 chip, 9chip. Whatever. Though do try to use all the same type if possible.

If your STE is one of the later ones with sipps, then youll have to do some soldering.

Smeg.

Absolutley. Although the reason why people use an RGB monitor in the first case is because its a lot sharper than a TV, and reading text in medium res is a good reason to get one, although games would benefit too, and you can always use the monitor for other things... (I used to use mine with a VCR as a TV, and I now use it as a monitor for N64, 3DO, Jaguar etc etc).

Smeg.

If you can solder, then the adapter is a piece of cake.

Most apps will run in mono.

The adapter connects the ST/e in hi res mono mode to a COLOUR VGA monitor.
The ST/e will be in mono, and the picture you will see will be mono. If you
want a colour display then its better to buy a used RGB monitor, or use the
TV.

> What is the situation with Mario Becroft? Is he still selling his
> products or what? Cheers!

He has been increasingly more difficult to get hold of lately.

Smeg.

But don't forget that "high resulotion" means 640*400 in this case.
On a 17" monitor you'll get a rather big display.

Which is exactly the point!!!! You can run Cubase or Notator from across the room!

Which some people do.

Or more sensibly, The Mega STE is often used to control the Einstein mixing desks where the monitor is 5-6ft away from the operator.

After using the SM 124 customers are always extremely happy to use the bigger display!

Any old 1mb 30pin simms from 386, 486 Pc's works a treat. make sure there all matching, dont use 4 different ones!

this is what ive put in my STE and it works perfectly. Shame it couldnt take 4 x 4Mb simms, then we would be talking potential.

I have a Wilhelm Microelektronik Spekrumgrafikkarte in my TT and it works very well except for one thing:

The picture has too much red colour regardless of monitor, resolution and colour depth.

Also it does not seem linear. When I set a screensaver in Bubbles to dim the screen it's clearly visible that on the way to black those parts on the picture that should be gray suddenly becomes gray, but are sort of brown normally.

This seems to be an analog problem. I suppose the colour strength is proportional to voltage on the three colour lines. Is this right?

Would it work to put in a potentiometer to adjust the colours? I've already set red to minimum on the monitor but that is not enough.

I have not yet inspected the card itself but there might be a dry solder joint or defect component that could be corrected. I do know how to solder but feel a bit uncomfortable to work on the card as they are hard to get...

I suspect it might be possible that your monitor is out of adjustment rather than the video card.

I recall fussing with the monitor I have presently for my PC quite a bit. When I bought it for $10, it came with a yellow hue over everything. I was told by different people things like a gun in the monitor was bad... a wire was broken, or something else was causing the monitor to malfunction. Basically... it was a dud monitor.

But something in me decided to tinker with it. So, open the case I did and turn those tiny little pots on the inside I did.... while the monitor was ON! I messed with R G and B over and over again. I knew what my Windows 98 desktop was supposed to look like, so I knew what was right, but it kept evading me for awhile. And then I finally got it "dialed in" and it was just right! Then I fine tuned the focus til I has razor sharp corners where the clock and Start are (a softer center is ok, less important information (maybe files and such) is there than in the corners)

If the monitor displays fine with another computer or with another OS, then, by all means... feel free to ignore this advice entirely.

Latre!

Luposian

This should have read 'half the vertical rate' of course, since

TVs use interlace with 50/60 fields/sec to give 25/30 complete
frames/sec. Sorry!

He's got it! By jove he's got it!! (Courtesy 'My Fair Lady'.)

Actually a VGA monitor can also take 640*480 mono on a Falcon, and as
already mentioned some old ones can take ST med and low rez as well!
I am using a very old IBM PS/2 greyscale monitor which runs under
MagiC and Nemesis (without Videlity) as in the table below (where
* = supported, - = not supported). I imagine that colour monitors of a
similar vintage would too (if there were any!).

The resolutions offered (and usable) are:

Greyscale 'colours':	2	4	16	256	32768
320*200 (ST lo)	-	-	*	-	-
320*240	-	*	*	*	*
320*480	-	*	*	*	*
640*200 (ST med)	-	*	-	-	-
640*240	*	*	*	*	-
640-400 (ST hi)	*	-	-	-	-
640*480	*	*	*	*	-

HTH

Yes, tht is correct (btw. in my last post i mistakenly quoted 15.1kHz
horizontal sync for colour mode; I stand corrected).

>Anyway, in that case a standard TV can be used (for those computers with
>an RF modulator that is).

Or, for a much better picture, a TV with a SCART interface which will
directly receive the R, G and B signals (though I have heard that on some
cheaper TV sets SCART specification is partially implemented, containing
composite video only).

Btw. a couple of weeks ago I was given an old monochrome 15" SVGA monitor
which turned out to be a Tatung OEM product capable of 1024x768 resolution;
on my Mega ST with the two-chip Lacescan (overscan) hack it displayed a nice
ST-high picture with a resolution slightly above 750 (!!!) x 480. Maybe
I'll play with it a little bit this summer, it seems like an electrolytic
capacitor or two might need replacing (there is a slightly brighter vertical
shadow over the picture near the left screen edge). It also handles the
ST-med/lo vertical sync of 50 Hz but not the horizontal 15.7kHz; maybe
I'll try to convince it to handle that as well- the monitor uses a standard,
documented, LM1391 chip for horizontal sync; possibly with some tweaking
of appropriate components around the chip it will go down to 15.7kHz-
and if it doesn't- well, after all, it didn't cost me anything.

You tried different monitors?

>I have not yet inspected the card itself but there might be a dry solder
>joint or defect component that could be corrected. I do know how to
>solder but feel a bit uncomfortable to work on the card as they are hard
>to get...

It may be that the RGB DAC on the card uses current outputs, and on the red channel, the resistor to ground (something in the 75Ohm range) is bad or has no connection - that might lead to an increased red level.

Are you shure it is non-linear? A too high red level will also yield a red/brown shift on gray tones without nonlinearities. However, a too high level might also cause nonlinearities in the monitor's input amplifiers to show up.

Hi All!

Can someone help me with Cab 2.7c?

Many sites these days use cookies. I have got them enabled in Cab, currently using the "Always Accept" selection.

However many sites complain that cookies aren't being accepted. I know that these do work on some sites though!

Why?

Is there nothing else I can do?

I am using Sting v1.26 for TCP/IP and Dan Ackerman's CAB OVL v1.4401, under MagiC v6.01 on my Falcon030.

Cheers,

James

Look for the Electrolytic that smooths the 150V supply to the Video
Amplifiers, there's possibly one on the CRT PCB as well as one in the PSU.

Could it be your power supply is dead??? I would look at the ST's
motherboard and see if everything is ok.

I have a 1040ST with the same problem. When I re-seat the TOS
chips, it works fine for awhile. That may be your problem.

Hope you don't mind me asking, do you have an English manual/sofware
for it? I have one in my Mega STE, but it's all in German.

Mark.

My manual and the two floppies are in German too, but fortunately I
understand enough German to be able to read it.

I use NVDI and have never tried the original Spektrum drivers.

Do you notice any red/yellow on gray parts with this card?

Not too many resistors on that bord and all seem to have good contact...
I did however find some ceramic capacitors that were soldered in parallel
to each other on the board next to the DAC chip. Almost looked like a
short between the two legs and I cleaned it up.

Now it seems the grey parts of the image are a slightly less
yellow/brown, but still not good.

It also seems to be related to heat or something. When runned at it's
maximum speed 84 Hz for a longer time it gets worse. On this LCD I have
it set to 60 Hz 1024*768

>Are you shure it is non-linear? A too high red level will also yield a
>red/brown shift on gray tones without nonlinearities. However, a too high
>level might also cause nonlinearities in the monitor's input amplifiers to
>show up.

Could be the monitor too but when I dim the screen I get:

First more red on grey parts
Next white parts become red
When the screen gets more than halfway dark colours seem normal until it
fades out.

Oops, mixed up! I meant dot frq at 84 MHz compared to 65 (not 60) Mhz!

these power supply's die all the time, but can be repaired easily if your an
electronics enthusiast. Failing that. an old pc power supply can be made up
to use externaly. and works perfectly.

Thanks for the input, Smeg... I happened to have some 1 mb 70ns simms
laying around and put them in. Lo and behold, they worked!   Too bad all
ST's aren't that easy.

Thanks again!
Jon

Hi;

Thanks for the tip. Otherwise I was inclined to look at horizontal-stage
capacitors first- I got an impression that it was a matter of something
causing nonlinearity, the effect being much more pronounced when there was
a fine raster on the screen, than when there was pure white.

Is this a common fault on monitors? I sort of remember that I have seen this
same symptom (i.e. a couple of slightly wavy, shadowy, brighter vertical
lines about 10mm from the left picture edge) before, maybe on a SM124
a couple of years ago.

cu;

No, not on any monitors I've tried. I'll check next time I boot it up.

>I use NVDI and have never tried the original Spektrum drivers.

I'm intrigued. I've been trying to get those two working together. I've got NVDI working with Notator at ST high. Then I found Logic 2.0 runs in higher resolutions, but I couldn't get NVDI to speed up the achingly slow screen updates.

Doesn't help with your problem though. Sounds like you know a bit about it, can you get the output tested at a repair shop? That might isolate which area to look at.

I remember as I'm writing this, I was in touch with the guy at Wilhelm, when I first bought the card, to find the English manual. Those messages are on the Atari, I'll look through them for any clues, but he did say all the Atari stuff went when they moved in the 90's.

Mark.

Ben,

Honestly these days it's probably easier to get ahold of the required
hardware to do a DIY 1.44 Meg HD floppy upgrade to your ST's.

Mark

I had one slight problem when starting Xaaes this way. I forgot to activate the moose.xdd and Xaaes went mad.

I realised that if the aes didn't start it would be difficult to access the /etc/tytab file to change it back to N_aes because ttytab is on a Unix partition.

Would it be a good idea to change ttytab so that it just points to any aes:

```
         console   "/usr/bin/aes"    tw52 on secure
```

and then change the link in mint.cnf to:

```
         sln c:\n_aes\m_aes.sys  u:\usr\bin\aes
or       sln c:\xaaes\xaaes.prg  u:\usr\bin\aes
```

This way, if the aes fails to start for any reason it is possible to change it back to the stable aes by editing mint.cnf on C:

I may have asked this question before, but, does anyone know if it is possible to run two disk drives from the MegaST internal drive cable. Iv'e tried using the second drive with a twisted floppy cable and it didn't work. I also tried using an older Chinon EZ354 drive (which has jumpers for DS0, DS1, DS2, DS3). I'm assuming these are to force the drive to drive 1-4. I tried changing these both in the twisted side and the nontwisted side of the cable, with no luck.

I have a MegaST in an IBM case and would really like to have both the A and B drives totally internal, without having to run a cable from the external floppy port on the back.

Has anyone gotten a second drive working on the same internal cable as the A drive?

Dave

Plug it in, turn it on.

If a few seconds later you're looking at a green desktop with white icons, it has TOS IN ROM.

Almost ALL 520STs came with TOS IN ROM.

Only a very, very few, at the very, very beginning were rushed to market with the disk boot TOS.

Would anyone have interest in an Atari 520 ST, which includes the color
monitor (SC1224), SF314 single density floppy drive and an SF354 dual
density floppy drive. Some other hardware includes Digisound ST and
Computer Eyes.

I had a STacy 4 with a 20meg hard drive.
The hard drive died, so I opened it to see about finding a replacement.

I put it back to together without the HD and used it for some hours, when the
display began look noisey. So I opened it up again to check the plugs and
whatnot.

Now...I have a STacy sitting here with no hard drive or host controller in it.

When I turn it on I get nice bright grey screen with a blue frame and perfectly
spaced blue lines (looks like car's rear defogger). I don't think the screen
itself is bad, it's a new screen with only a few hours on it supposedly.

The SM124 monitor plugged in has a tack sharp picture and running programs from the floppy seems to be fine. Note, the STacy display is the same wether the SM124 is plugged in or not.

The cables and wires appear to be fine tho' I can check them even closer if anyone has ideas where to start.

I'm afraid the video board to the LCD has gone bad.
There are two trimmers on this board...one marked 12V and the other 5V.
It's pretty obvious where cables come off this board to hook up to a hard drive.
I've checked the trimmer settings with a voltage meter and they are right on the mark (5V and 12V respectively).

The components on this board look pretty much like stock capastors and whatnot, but again, I've no idea where, or how to start looking for a bad component.

Can anyone clue me in on what might be wrong here?

Thanks,
Brian

Yes, I have done this.  My mega is in a tower with two drives.  However,
I can't remember if I had to put a jumper on the board to get it to work.

Richard

With one as 1 and the other as 2, it should work BUT only one drive should have terminating resistors!! Also, i discovered that drives for PC have a different value for the terminating resistor by ... frying out the disk controler chip in my ST.

So beware...

Good luck!

I pulled my system open and checked it.  I did have to add a jumper from
Pin 19 of U16 (Yamaha Sound Chip) to Pin 12 of J12 (floppy connector).
I thought I remembered having to do something like that.

Richard

Richard, if you can take a look inside of your machine I'd really
appreciate it. I have almost everything else internal. I even made a
cable to allow my ICD ADSCSI+ card to work off of the internal
connector for the DMA plug. I also hooked the SCSI cable up so the
cable ends at the back of the computer and is unterminated. I use an
External termination block instead. This allows me to add more SCSI
devices externally if I want to. It was a fun project, the only real
problem I am having besides the drive is that the Motherboard sits on
it's side and the chips like to wiggle loose, causing the system to
crash. If I run it with with the MB laying flat it runs for hours.

Dave

I had replied to myself already with the answer, but maybe it hasn't propagated
through all of the news systems yet. Here it is again:

I did have to add a jumper from Pin 19 of U16 (Yamaha Sound Chip) to Pin 12
of J12 (floppy connector).

Your system sounds interesting. I can't remember when I put mine in a tower case.
It has been a long time. I haven't used my system much in quite a while, but I
cannot
remember having any problems with the chips. I can believe it though. I use to
fix these things back in the late 80's and early 90's. You have something I plan
to
try. I have an ADSCSIMicro, so I didn't have to make any special cable to hook
it up internally, but I want to change it from a female SCSI connnector to a male
one. That way I can hook up more devices, including an external
connection/terminator. I also have some working Syquest 44's that I bought at
second hand stores for under $10 a piece.

Good luck with the floppies,
Richard

I tied several smaller SCSI drives with my SH204 and was not able to get them to work. Though I only used AHDI 3.1 and 6, maybe the newer HDDRIVER programs would work? I tried a Quantum 80S and Maxtor 120MB SCSI.

Did you use a twisted cable like an IBM type machine or did you have
to jumper the drive to be a second drive in the system. I could try
and figure it out by trial and error, but it sure takes alot of time.

P.S. Where did you come up with such a trick as the jumper to make two
drives run? Sounds like you did more than just fix the darned things

dave

(previously asked in comp.sys.atari)

Since I got my STacy back out of storage, I am unable to share files on a
Win98 formatted disk.
Yes, I formatted it as 720k.
Yes, I tried using a TOS-formatted disk in the Win system. Neither system
reads a disk formatted by the other.
I made sure the disk drive in the STacy is not malfunctioning by reading
files from a TOS-formatted disk I had lying around. No problem there.

What gives?

Hello.

I have a few red Cubase v3 dongles for sale.

They are in good working order, the cases are covered in gaffa tape glue but will clean.

Price is �45 each inc. special delivery post in the UK.

I will post overseas if required.

I am using a straight cable, and I changed the jumpers. You should be able to use an IBM style twisted cable as long as both drives are jumpered as second drives. All the twisted cable does is swap the connections to pins 10 (DS0) and 12 (DS1) on the floppy. The other wires involved in the twist are just ground. As has been mentioned in other floppy related threads, current floppies are pre-jumpered as a second floppy. Some cannot be changed, or, at least, not without a trace cut and a jumper wire on the board. I cannot attest to Benoit's statement about terminator values on newer drives, but it certainly sounds reasonable and is something to consider. As for my system, I took a look while it was open. I am using some older Newtronics/Mitsumi mechanisms, which I believe to be high density--they have jumpers related to HD behaviour. I cannot tell you anything about terminator values, as neither drive has visible terminators, nor do they have places where they have been removed. I did not remember this, but it has been a while since I did this. I cannot say how many hours the system has been used since this change, but I did not use floppies extensively once I started using a hard drive. So, I guess there could be a potential for damaging the controller with this configuration, but I have not had any problems yet.

> P.S. Where did you come up with such a trick as the jumper to make two
> drives run? Sounds like you did more than just fix the darned things

When I got tired of all of the cases and cables and decided to recase the thing, I checked to see if there was a drive select on the internal for the second drive. When I found out there wasn't, I just found the closest source for the select signal and jumpered it.

Richard

What are reasonable prices for these items (software is original of course, no copies)?
Hardware is 220/230 Volt, 50 Hz. Don't know if they contain internal switchable power supplies or not (?).

* C-lab Falcon mkII with math processor, 4 MB RAM. This is the Falcon with excellent audio in/out.
  Cannot remember the size of the internal hard disk, but I think it's around 500 MB. The package includes
  paid versions of HDDriver, Freedom, a commercial resource editor. And there's some freeware on the
  hard disk, for example an installation of Csound with special routines to replay audio from hard disk.

* Atari's monochrome monitor

* Lattice C for Falcon

* Devpac DSP - development software for the Falcon's DSP

* Blow-up coax and optical DAT interface (I have a DAT recorder for sale as well and lots of tapes, might consider a bundle)

```
  (coax in/out and optical in/out). Switchable between 44.1 kHz and 48 kHz.
Perfect operation with DAT recorders, useful for
  backup of data from the hard disk as well as recording audio from Cubase
Audio. Comes with an additional commercial
  software package to take backups (cannot remember the software's name, but
it was a separate buy).

* VANTAGE 2000 card with 16 MB RAM

* Cubase Audio for Falcon

* Studio Module + Style trax for Atari Cubase (e.g. Cubase Audio). Studio
module is a sound editor for many synths
  and style trax is a programmable real time auto accompanient for Cubase.
This was a separate buy from Cubase Audio.

* Papyrus (word processor), produced very nice printouts on my HP Laserjet.
Comes with drivers for lots of common printer.

* SyQuest EZ-Flyer with 2 (or maybe 3) cartridges. 220 MB each. And SCSI
cable. Works fine with the Falcon and HDDriver.

Thanks
M

Funnily enough, after all this talk about floppy's Ive just had to change
the 1.44m floppy in my falcon as it wasnt reading disks properly that were
written by my laptop.

I bought a brand new ALPS floppy drive for a few quid from my local store.
There were a couple of little solder pads marked DS0 and DS1 and as expected
DS1 was joined, so I just changed this and it worked first time.

Anyone in the UK need a floppy drive for thier ST/Falcon get in touch with
me and i'll see about getting one to you with the jumper changed.

Smeg.

Mike.

I think everyone is waiting for you to offer the stuff really cheap ;-)

I personnaly may be interested in the DAT + interface for my cubase audio
setup, but I have no idea what it is you have.

Smeg.

Hehe. Well, I need to know the going price for these items. And if I can't get the answer here, then I'll find out somewhere else, e.g. eBay ... :-)

>
> I personnaly may be interested in the DAT + interface for my cubase audio
> setup, but I have no idea what it is you have.

The DAT recorder is a SONY DTC-690 with remote control.
220 Volt / 50 Hz with Scandinavian type wall plug (two pins).
Quite neat setup, I have made lots of Cubase Audio backups using this equipment.
The VANTAGE 2000 card speeds up the Falcon to 32 MHz, which is very nice
for those working with the processor intensive Cubase Audio.

/M

Have patience, we don't all read the posts every day!

A lot depends on which body of water surrounds your domicile, in other words, WHERE ARE YOU?

Values vary depending on how much carriage and currency charges will be.

As an example, a Mega STE or a TT will cost $60 US to ship to the US from the UK

Are you willing to split or take a lump sum to clear the lot?

Anyone wishing to sell here should have the sense to include their country
or a recogniseable address, such as www.keychange.co.uk

In Sweden. That's northern Europe for those who don't know. :-)
Not too far away from the UK.

>

>
> Are you willing to split or take a lump sum to clear the lot?

I'd rather split it.

I should add that I also have the following software (for sale):

NVDI 4
ExtenDOS Pro 2.4a (CD-ROM driver)
COMA (fax software)

I guess around �6 for each of these 3 software packages would be
reasonable (?) + shipping (probably around �2 or �3).

Buyer pays shipping so buying more would be a smart move.
On the other hand, shipping cost is not much for these. A lot more
for the hardware.

Maybe I should estimate the price for each of the items and post a
new list...

Cheers
Mike

What TOS does your STacy have in it? If it is less than 1.4, then
you will need a TOS formating program that will format a TOS disk
and put a PC boot sector on it. I have such a program. If you do
not have one or cannot find one, email me. I will send it to you.

Every TOS versions can read and write WIN98 (and DOS) formatted disk.
I suspect a malfunction on the Stacy drive, either bad aligment or wrong speed.
It was quite frequent in those times if i remember well...

You mean that every TOS can read a DOS disk, and every TOS can write files
to a DOS formatted disk?

Just to clarify, You cant format a disk if you have less than TOS 1.04 ST or
1.06 STE that will be readable in DOS

Smeg.

Anybody tried to get STAC going on STEEM?

I can get the adventure to play but can't edit the Conditions, they are all replaced by ".>>".

Need to emulate a MSTE/TT Keyboard using my PC // port.

So to achieve this, i need the keyboard scan codes,
and if possible the keyboard pin-outs.
Somebody have this ?

They all fail at exactly the same point, where a trace runs over a sharp edge. I used a very little drop of Nickle Print, which has different names in different countries, and is cheaper than Silver Print.

Wait a very long time, at least two days, before putting the mylar back in, since that material hardens very slowly.

Before it goes back in, round the corner of that sharp edge, and perhaps put some tape over it as padding.

Worked for me.

Jim

There is a CPX that gives scancodes for every key pushed. They are also in appendix F.5 of the Atari Compendium. KEYCODES.CPX is the CPX name.

Yes, I have the scancode list, but it would be a tremendous lot of typing of numbers.

The keyboard has its own processor and programming. Its output is to a six conductor modular telephone cable. Pin 1 and 2 are Vcc, pins 5 and 6 are ground, and pin 3 goes to TxD on a MC6850 chip, and pin 4 goes to RxD on that chip. The keyboard transmits the scancodes as serial data.

That, at least is true for a TT. If you can use a MSTE keyboard on a TT, and vice versa, it is also true for a MSTE.

Here's a program I wrote to change the ST's keystroke tables.
It contains tables to translate scancodes to ASCII, so it may help.

Steve.

```
;   By Steve Adam of Brisbane Australia.  Assembled using MADMAC from Atari.
;
; * * * * * * * * * * * * * * * * * * * * * * *
; * * * * *   ENDS WITH KEEP PROCESS. * * * * *
; * * * * * * * * * * * * * * * * * * * * * * *
;
;
;       *   Dinky program to set up keys suitable for an AST keyboard
;       *   using the DEKA keyboard adapter.
```

```
;
              .text
;
              movea.l   a7,a5
              movea.l   4(a5),a5       ;prog base page start
              move.l    $c(a5),d0      ;length of prog area
              add.l     $14(a5),d0     ; + data area length
              add.l     $1c(a5),d0     ; + bss area length
              add.l     #$100,d0       ; + base page length
              move.l    d0,keepsize    ; save size of prog to keep.
;
              jsr       _main          ;go on to main program.
;
exit:         move.w    d0,-(sp)
              move.l    keepsize,-(sp)
              move.w    #$31,-(sp)
              trap      #1             ;KEEP PROCESS, END PROGRAM.
;
;
_main:        move.l  #capslock,-(sp) ;   The addresses of the three 128
              move.l  #shifted,-(sp)  ;   byte keyboard tables.
              move.l  #normal,-(sp)
              move.w  #16,-(sp)       ; Xbios function 16, Keytbl.
              trap    #14             ; points TOS towards our Keyboard
              adda.l  #14,sp          ; tables.
;
              move.l  #message,-(sp)  ;A short message so
              move.w  #9,-(sp)        ;we know it's been done.
              trap    #1              ;GEMDOS function 9, Cconws.
              addq.l  #6,sp
;
              move.l  #0,d0           ; Return a 'no-error' code
              rts     ;Back to exit
;
              .data
;
;   Each of the following three tables contains exactly 128 bytes.  The values
;   are the ASCII codes corresponding to the scancode of each key.  When you
;   press a key, TOS uses the scancode of the key to look up one of these
;   tables to find the ASCII value for that key.  For example, the ESCAPE key
;   has scancode 1 (Esc = 27 decimal).  If the Shift key is pressed or you
;   have Capslock on TOS will look up the corresponding table.

On Fri, 13 Jun 2003 13:41:11 +0000 (UTC), "Smeg" <smeg_007@NOSPAM.hotmail.com> wrote:

>You mean that every TOS can read a DOS disk, and every TOS can write files
>to a DOS formatted disk?

Absolutely. But older TOSses do not know how to handle the MS-DOS volume label, it shows up as a file with 0 bytes length. You can delete it safely. Also the long part of the "long filenames" of WIN95 and up will shows as bizarre files on some TOS versions but i do not know wich of them...

I use FDFormat 1.8, to format all my disks. It was written by Christoph Hochstaetter a few years ago and with it you can:

- format ultra-high capacity disks (820k and 1.72meg)
- format DMF disks, the format used to distribute WIN95
- do sector sliding, the trick found by Dave Small to double access speed on the ATARI
- choose the interleave factor, to increase even more access speed
- and play around with other factors like the gap length (at your own risks)!
- keep a perfect compatibility between DOS and TOS disks.

The only problem is that it can be used only on pre-Win98 machines (i always keep an old 486 win Win95 in working condition for old apps, old games and for FDFormat)

You can get it on SimtelNet; try this:
ftp://ftp.cdrom.com/.2/simtelnet/msdos/diskutil/fdfrm18.zip

>
>Just to clarify, You cant format a disk if you have less than TOS 1.04 ST or

>1.06 STE that will be readable in DOS

I know that the first TOS used a so short gap length that DOS could not read the
header of the first sector of each tracks. I dunno for other TOSses...

>ATARI

I have just spend the whole morning doing some tests with four of my computers:
two Atari, a 1040 TOS 1.0 and a MegaSte TOS 2.05 and two PC: a 486 with Win95
and a Duron 733 with WinXP. Here are a few results:

First, a TOS 1.0 formatted disk can be read/write only on Ataris,
- a Win95 formatted disk can be read/write everywhere
- a TOS 2.05 formatted disk can be read/write everywhere

- WinXP cannot format 720k disks but can read/write them
- FDFormat does NOT run in a DOS box, and definitively not under WinXP
- Sector sliding effectively double the read/write speed
- WinXP is happy with sector sliding
- WinXP is not happy with ultra-high capacity disks (820k and 1.72meg)

The last point is interesting: for months i had tough that my disk drive on the Duron was defective while in fact it is WinXP, with the most sophisticated file management system of all, that understand nothing but plain old DOS formats...

Conclusion: if you only have a TOS 1.0 Atari and a WinXP machine, you're in deep troubles: they cannot be networked together, WinXP will not read TOS 1.0 disks and WinXP will not format 720k disks, the only ones that can be read/write by TOS 1.0!!

Two possible solutions:
1- find a friend with an old 286, 386 or 486 with Dos 3.1 or above and spend the whole afternoon to format a bunch of 720k disks with sector sliding.

2- go to a flea market (or a garage sale or ...) and buy an old 286, 386 or 486 computer, usualy less than 5$ now... Do not look at it as an old computer but instead as a hyper-sophisticated multi-processor floppy disk formatter machine!!

Have a good day!

Beno�t Morrissette...

P.S.
By the way, the old 286 can also be used as:
- an alarm clock,
- an automatic praying machine like this:
```
     10 FOR I = 1 TO 10
     20 PRINT "Ave Maria"
     30 NEXT I
```
- a door stop

OOPS, i forgot...

My old MAC SE30 can read/write 720k DOS formatted disks
but will not format them (of course!)
I haven't tried read/write 820k and sector sliding on the MAC but i suppose that newer models should have no problem with them...

All of the URL's I have for his site are not working as I write. I have had this before, only to find it back up a few days later.

Maybe I should leech everything off there before it goes down for good...

Smeg.

It's not only that. TOS 1.00 and 1.02 wrote two different bytes at
the very start of the boot sector, which DOS couldn't make sense of.
But there are programs for the Atari that write an MS-DOS-compatible
boot sector to those disks. One is DISKMOD.TOS (around 7 kB) which is
used with a 512-byte BLOCK0.DAT file containing the actual IBM-style
boot sector. It leaves any files on the disk untouched.

Regards, /Peter/

Hello!

> How does init know which aes to start ?

Do you start it from shell or it is automatically started? If
automatically take a look into /etc/ttytab.

Tschuess

Try to purchase from Best Electronics. They sometimes re-sell copies
obtained from Atari Workshop in the UK.

That makes sense, because I remember that all the 720K drives we were
getting into the store actually had the 1440K sensor (or the place on the
PCB for it). This also happened later on when 2880K drives came out, all
1440K drives had 2 sensors on the left hand side. Ok the OS wasnt to know,
but the drive sure as hell didnt like it.

Smeg.

> it's a 720K disk.

Doh!, You muppet!, you've already been told that this is a waste of time due to the switch/sensor doing the sensing of the covering device being non-existant, you might as well tell everyone to pick their nose while they use these disks in this manner.

Get a program that will give you all the specs of the machine, like SYSINFO, PROFILE 2, or others.

Do some Googling to find them, we are not going to hold your hand. ;) LOL

Tim

Yes... "attempts", being the operative word. But without a driver, it
can't, can it? Hence, the matter is a moot point if the Megafile30 has a
wiped/corrupted bootsector, which is what the driver/utility program is for,
right?. What the ST can or can't do is predicated upon a functioning boot
sector or HD utility program to install one on the Megafile30. I've been
out of the ancient/archaic Atari ST realm for so long, not sure my memory is
accurate on much of anything relating to that nigh useless platform these
days, but I believe I'm correct on that point, plus or minus a few others.

Luposian
"If Atari HAD done, what they SHOULD have done, WHEN they should have done
it... Atari computers would most probably be where Macintosh computers are
today..." [personal opinion]

If anyone, and I mean ANYONE, wants to make me believe this is actually going to work, they will first have to put THEIR money where their mouth is! Send ME even $1 (even via PayPal! Hey, now there's a thought! A new way of sending and recieving scam money!) and I'll *think* about doing this.

But I am sure, along with those Nigerian "twenty-three million dollars" offers and the tons of "Microsoft Security Patch Update" Emails I get, this is no different...

And the non-US addresses don't make me feel like shelling out postage for this offer much more either.

My wife tried it... nothing happened. I've *never* tried it... nothing happened. Gee, same difference!

I am a dumb Amiga user that was spoiled with such an easy to use and great working OS... LOL

NOW... I want to use MiNT on my new toy: An Atari Falcon030 ;)

Any guides or sites on how to install a nice setup of MINT?

Thanks!
Tim

I am having bad problems in downloading the various files from
atarigames.net which is the homepage for winston emulator, i use the
standard download option (save straight to disc), or I try and
download using flashget or DAP, and it wont let me download (is there
a problem with this web site)

In addition, the above named website made mention of SteW emulator
v2.0 (is this basically winston v0.5), if stew is a separate emulator
(as I have version 1.0) where or how can I download this version
(v2.0) or is it just a w.i.p report

any help please email carmel_andrews@yahoo.com

additonally, I notice that when using steem (any revision) that steem
doesn't reside in the same area of pc memory every time you boot it up
(even if you are using the same tos version ea. time), I found this
out be using steem (v2.4) and a pc memory trainer (allows you to find
locations for lives energy etc.. I use artmoney v6.26 game cheater-
works like AR for megadrive/snes etc, but w/o the addit. AR
features)every time I search for lives etc, the location keeps on
moving to different areas, would I be right in saying the steem loads
into pc mem. dynamically, or statically

The over problem I have with steem is that I cant figure out where in
the PC memory it is trying to load the ST program from, I've allready
figured out the load points for winston v.2 and v.5, and also saint
and stew, but on steem using either a hex memory editor or memory
finder I still cant find ourt where in pc mem steem starts to load st
programmes

any help, please use above email

atarily yours

c a

I already have Ultimate ripper cart running on steem, now I am looking for cartridge images of the following to download and use (for my own purposes ofcourse)

TCB explorer
Multiface ST
Supermon

In addition, is there any possibility that stew/winston and saint eventually be able to accept cartridge images, if so... when...

atarily yours

It's the first time I'm posting here, so hello everybody. And excuse me for my english.

First, here's a question which I suppose has been asked before lots of times, but I don't have a clear answer. How do I make an Atari ST to SCART cable?
I've found (among others) these three documents:

http://www.stcarchiv.de/stc1986/04_monitips.php3

http://www.google.com/groups?q=+atari+and+scart+group:*atari*&hl=es&lr=&ie=UTF-8&oe=UTF-8&selm=7ina6e%24ei6%241%40zingo.tninet.se&rnum=1 (this one comes from an old post in this ng)

http://www.howell1964.freeserve.co.uk/Atari/ST/Atari_ST_Video.htm

They're all different.
I made a cable very similar to the one of the second document, and it worked. But then I red that I should need three resistors between the red, green and blue connections (I don't remember the URL, but the explanation was similar to the one in the third document), if I didn't want to burn the TV. The problem is that this second cable doesn't work properly.
So I'm very confused. Any idea on how to make this cable?

I've a second question... does anybody know if this cable works with an Atari 7800 with a RGB/Peritel connector? is it the same?

thank you very much for your attention

regards...

jaime

That is probably because there are many different implementations of SCART.

Hello!

I have an old Megafile 30 Hard Disk.
But only the HD, without useable
case or powerline.

I wonder if it would be possible to
read all data connecting this HD
to a PC. I hear it is somewhat SCSI
compatible. What changes would be
needed? What alternative ways are
there to rescue the data?

Thank you very much,
Hermann Samso

When I turn on my Stacy 4...

The screen is nice and bright, but it only displays blue lines.
The batt light comes on and stays on.
Plugging in an SM124 monitor reveals that the computer is working...just something is bugged on the screen.

Any ideas?

Brian

Go to a junkyard sale (or a flea market or...) and buy an old 386 computer for 5$. Bingo!!! Instant case and power supply!

The hard disk (Seagate, probably) is exactly and perfectly SCSI compatible. So all you need is a SCSI card for your PC. I am not sure but i think that the ATARI format of the HD is close enough to be read by a PC. What i am sure is that a PC formatted HD can be read by an ATARI.

Have a nice day!

Now that could describe my situation. I really do not know. I bought the STe off of some guy I met here on the UserGroups. All I know is that I accidently tried to format a 1.44 meg disk in the STe drive and started getting problems. Then a gent in my computer club suggested covering up the 1.44 meg hole. I was then able to use the disk fine in the STe.

In my years of being an Atarian I have found 3.5" drives can be very funny. You format a disk in one drive and only use it in certain other drives would could mean a difference in alignments or else other things.

They also at one time used RLL interface drives. Does the drive have one 50-pin connector or two (34 "pin" and 20? "pin") card edge connectors. If it has the 50-pin it is SCSI and you should be able to connect it as Benoit said.

You're not even located in America, so I doubt your words have much weight, Steve. Besides, only a low IQ individual would assume my words to be effort to actually GET the aforementioned $1 from anyone! You're not too keen on subtle sarcasm, are you?

However, it *would* seemingly be an easier way of "spreading the wealth", as it were, since you can pay people online! But it would require that all recipients be PayPal users and actually fulfill the requirement of the scam (send the whatever), lest it be shut down quite quickly via a slew of locked-down PayPal accounts.

In all actuality, I'd probably be even LESS likely to send someone money if such a suggestion were made... seems even more "scamish" (is that even a word?) than the "$1-by-mail" idea.

Personally, I don't think it would get very far as an idea... but it was a funny thought, tho.

Luposian

In general yes, but depending on your OS you may not be able to use
all of the JAZ drive.

>Damn why is it so hard to access PC HD's on Atari when it is supposed to be
>native. Wasn't this hard on Amiga...

Om STs versions without onboard SCSI, you need an DMA->SCSI
adaptor. Parallel ZIPs don't work on the Atari due to some
missing lines on the printer port. Otherwise it should be
straightforward, provided the filesystem is the same (basically
DOS). I thought that the Amiga used a different filesystem
anyway...

Hi Tim!

If you want HDDRIVER with an English manual (highly recommended),
then that is available *only* from Atari Workshop. They accept
credit cards. Price is UKP 29.95, which is around $48 at current
exchange rates, I think. Upgrades from earlier versions are
cheaper, though you have to return the original disk and manual.

email them on info@atari-workshop.co.uk

Regards, /Peter/

This has been pointed out to me on the new Xaaes website forum.
I managed to get it running. It's the first time I've had Xaaes
running succesfully :-)

I'm starting a new job next week which will mean less time to play with the Milan. I think everyone will be glad of a rest from me asking questions ;-) I've just got time to fit my new gfx card.

Regards,

Peter

OOPSSS!   I have just opened my MegaFile 30 and i think we have a problem here...

The MegaFile 30 is composed of 4 parts:
- The drive itself, a Seagate ST-238
- The power supply, an electronic board about 9 cm by 14 cm.
- The interface card, an electronic board about 17 cm by 30 cm.

- The external case itself, including the fan.

Now tell me wich of these parts do you have and wich you don't because...

The ST-238 drive use the RLL encoding technique so to operate it you need either a RLL interface card (yes, i have one) OR a SCSI interface card that understand the RLL encoding technique. In the latter case, you may be able to rescue the data on a PC but it is not garanteed. In the former case, it IS garanteed that you will NOT be able to salvage the data on a PC!

IMHO, your best option is to find another MegaFile 30, to hook your drive in it and to save your data on floppy disks...

Good Luck!

Is there a program available to run on an Atari 1040 ST
that will save the TOS ROM's in a form so the result can
be put on a boot disk for an Atari 520 ST???

Ho Ho, i smell a little bit of confusion here...

Back in those prehistoric times there were two encoding technique:
- MFM: Modified Frequency Modulation and
- RLL: Run-Length Limited

These are ways to encode bits on the magnetic surface of the disks. It has very little to do with the interface card itself. Let me explain:

A HD (of that era) consist of two rotating platters, four heads and two motors; one for the heads and the other for the platters. There is also a control circuitry to regulate the speed of the motors and a buffer circuitry to correctly modulate the signals to the heads. Finally we must have some circuit to control the positionning of the heads.

And that's it! We now have a complete bare-bone hard drive! Such a drive should have two connectors: a 20 pins and a 34 pins. Now if the magnetic surface of the platters is good enough, the drive can be formatted in RLL. If not, we have to stick with MFM. The only way to distinguish between the two is by the manufacturer spec, not by the connectors.

All of this is beautifull but this drive is not useable yet: we need an Interface card! In those time, you could buy either a MFM or a RLL interface card. The only difference is the encoding technique the card will use to "talk" to the heads. You can use a RLL drive with a MFM card but it will format with 50% less capacity. You could also try a MFM drive with a RLL card; if you are lucky, the magnetic surface will be good enough and you have a drive with 50% more capacity.

Now you will ask: Where is SCSI in all of this?

The Small Computer System Interface is an intelligent interface, a high-level one. When you initiate a data transfer between two SCSI device, they manage it by themselves freeing the computer of that task. The devide driver is simpler to write because you don't have to care about low-level things...

Now guess what? When you buy a SCSI drive, it is ALWAYS either a MFM or RLL drive with the appropriate SCSI interface board bolted on it! The best example i can find is in the ATARI SH-205. The Seagate SCSI interface is bolted over the Seagate ST-225 drive. You can take any MFM or RLL drive you want and put it in place of the ST-225 and that will work. The only difference is that a 80 megs RLL drive will be formated as a 50 megs MFM one...

It is true that around 1987, manufacturers began to incorporate both the RLL and SCSI interface on the same board underside theirs drives so these HDs have only one 50 pins connector. But the SH-205 and SH-305 are old technologies, meaning that the SCSI card is separated from the drive. These drives always have two connectors 20 and 34 pins and the only way to know if MFM or RLL is by the model number of the drive...

Hope i was not to boring...

Programs for extracting are not the problem - all you need to do is to dump
the corresponding memory area.
The problem in that case is that you need to relocate the TOS if you want to
load it from disk. You cannot directly use a TOS dump as a boot disk.
But you could use such a dump to create EEPROMS which would allow you to
boot the 520ST without the need of a TOS disk.

Benoit,

Thank you for the wonderful lecture. I am sorry you did not like my "misuse" of the term RLL. Generally from what I have seen, nobody usually discusses the encoding scheme when referring to a SCSI. My point was to whether it is a "bare-bones" drive or a SCSI. Very frequently the two connector interface was referred to as ST506/ST412 compatible interface--I guess Seagate made this interface popular. I do not recall any other interfaces in use at the time, but I'll bet there were some obscure ones. I do recall that most people, as the RLL drives started coming out, generally referred to drives as MFM or RLL based on the way they were spec'd. I also recall that many people did not have much luck pushing an ST-225 to 30M using an RLL controller. It could work, but I was always too concerned with reliability. I guess that is also why I rarely use a single-sided floppy as double-sided.

IIRC Atari went to a RLL encoding controller on the SH-305. I cannot remember if the Megafile 30 used a SCSI drive or a controller with an ST506/412 interface to the drive. If they used the latter, I wouldn't put it past them to build
an integrated AHDI to ST506/412 board. I do remember that it was not long after the release of the Mega systems, that internal HD add-ons--with the ADSCSI Micro and a SCSI HD--for the computer itself. I do remember that the SCSI drives were comparably high priced at the time, as they still are.

I guess what I am trying to say is that I was simply trying to assist in determining
whether Hermann's drive would simply plug into a SCSI controller on a PC. If it is a SCSI drive or he is lucky enough to still have the controller card, then he
can plug it in. Once this is done, I know there is at least one software package out there that can access data off of an Atari formatted drive. I just cannot recall
the name of the software of which I am thinking.

Thanks,
Richard

Does the 520ST have ROMs in it?  Or does it need the TOS boot disk?

  Yes, that is probablye the best
  solution to the problem. I have
  been looking in e-Bay, and there
  are nice "Angeboten" for Megafile
  30 HDs.
  The HD itself, without controler
  or case, is "only" 11 years old.
  So, I can only hope the data
  remains uncorrupted.

  Thanks to you, people of CSAST,

  Hermann Samso

Hello

Can a 1040ste use a 1.44 floppy disk? If not which Atari does? I am not sure of TOS version in this ste I do not have the computer here. Just trying to help someone.

Also an email to daja300@aol.com would be appreciated.

Thanks
Dave

Hi again

Anyone know where I can get a Link2 or Host Adapter for a 1040STE and scsi drive? ICD is way too expensive.

Dave

Link 2 is ICD.........

I have a Link 97 and 100mb SCSI for sale for �105. Plus shipping.

I have *not* opened the 520 ST yet, but I had assumed that
*all* 520's had to boot from a floppy...

Plain 520STs had to, the later mdoels like the 520STM, the 520STFM or the
520STE had ROMs.
But it is really no big deal to upgrade an old 520ST to use a ROMs.
The sockets are there.

Matthias

Can someone tell me are there any problems with using 1.44 Megabyte 3.5"
disks on a 720KB Double Density Drive. Where can I buy new 720KByte DSDD
3.5" Floppy Disks New with a good brand?

==Thanx==

Wonder how a Megafile 30 came to have an SH 205 lid.....

For sale, quite quiet, offers.....

I have an SH204, which is the shoebox shaped item, I seem to recall it has a
SCSI drive.

I've now got my network set-up using the Easymint/Sparemint scripts :-)

I don't know if it is related but the GEM X11 server has stopped working:

```
     Gtk-WARNING **: cannot open display: 0:0.0
```

Isn't the DISPLAY dependant on the network ?

Regards,

Peter

I wasnt flaming you, my above post was in reply to someone elses post, not
yours. I actually said that I thought you were a nice, helpful person,
though I think the bit about you not reading a reply properly before writing
another is valid dont you think? ;-)

without prejudice Ed.

Smeg.
